

ITTO Project Formulation Software Tool (ITTO ProTool)

ADDENDUM TO THE USER'S GUIDE

INTERNATIONAL TROPICAL TIMBER ORGANIZATION

March 2016

I. PROGRAM INSTALLATION

First, backup your old version of ITTO ProTool. Then, uninstall the old version, then install this new version.

IMPORTANT!

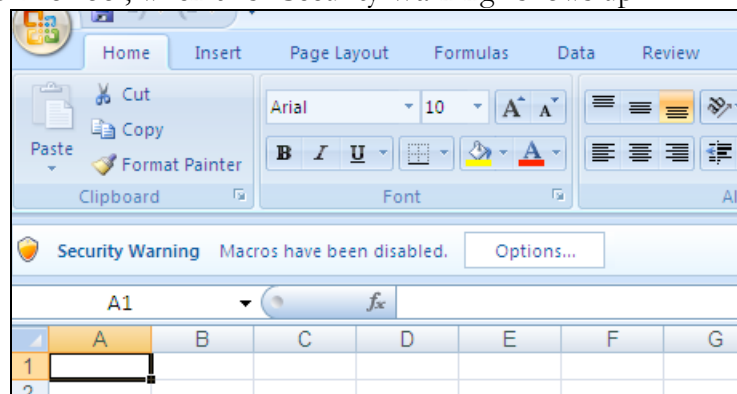

Please carefully read the User's Guide:Program Installation section, and also this addendum, for proper uninstall of the old version, and installation of this new version.

The major difference in installing the ITTO ProTool version 1.518 is that you do not need to install the Digital Certificate anymore. The new version does not need it anymore. The effect is to get rid of the expiry of the Digital Certificate. Thus now, the software has no more expiry date.

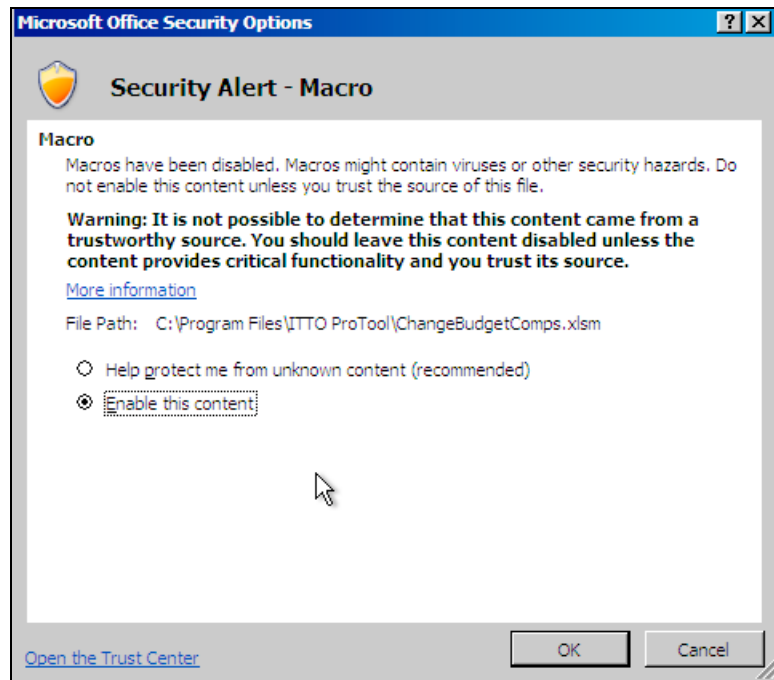

Another effect is that in the Office 2007 version, you have to keep doing the following, everytime you run the software:

For Office 2007 Users

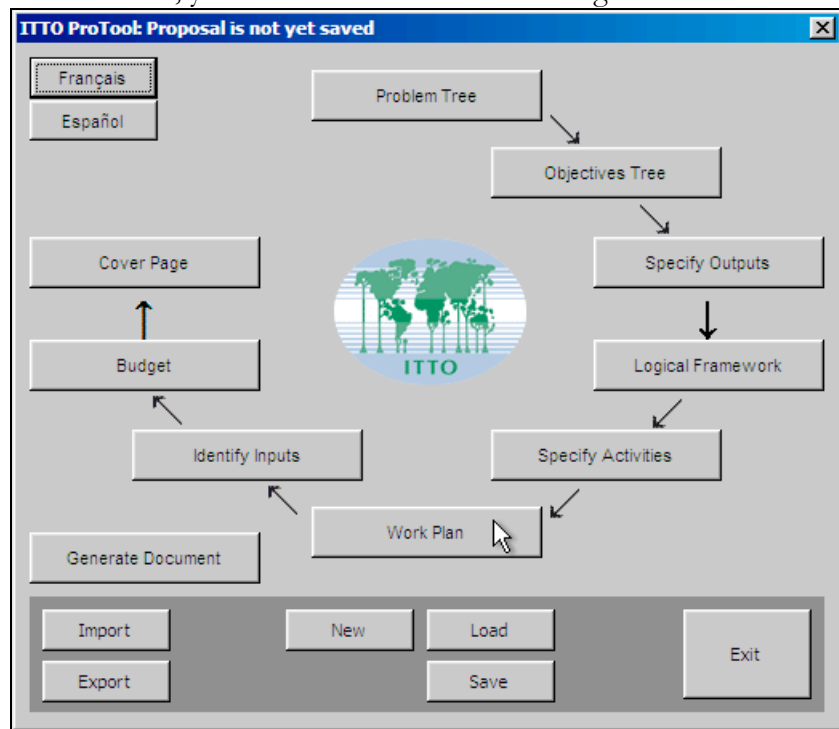

After running ITTO ProTool, when this "Security Warning" shows up:

Click on the "Options..." button, and the following screen shows up.

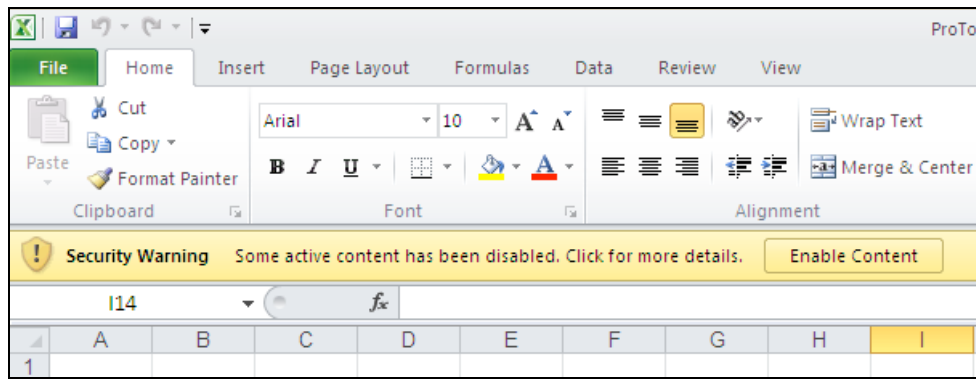

Make sure to select “Enable this content” so that the ITTO ProTool macros will run, then click “OK”. After several seconds, you should then see the following screen:

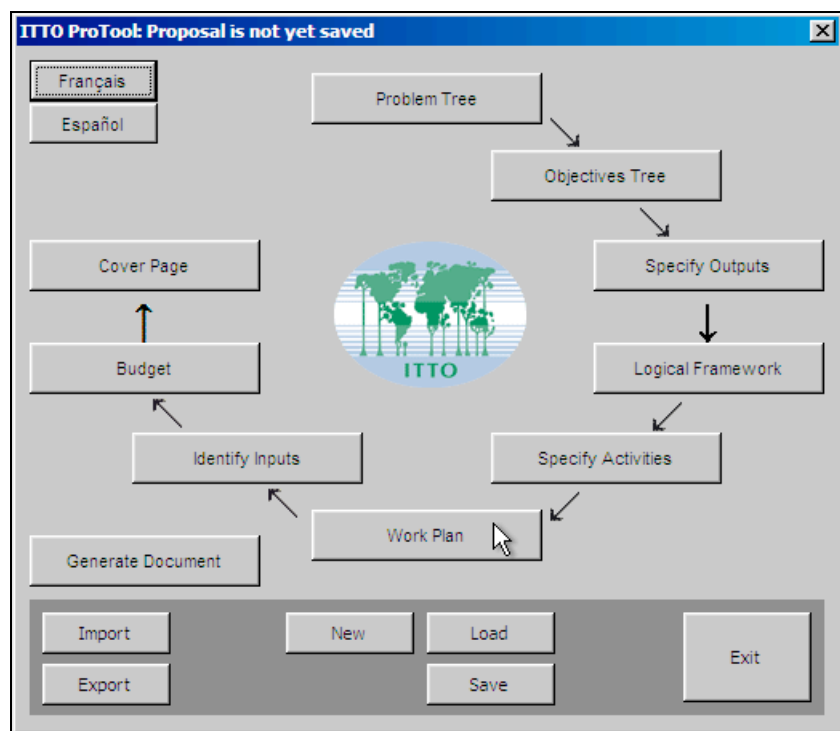

If the above screen does not show up, quit the Excel program WITHOUT SAVING. Then try running the ITTO ProTool software again.

For Office 2010 Users

After freshly installing the ITTO ProTool, and then running it for the first time, the following “Security Warning” message will show up:

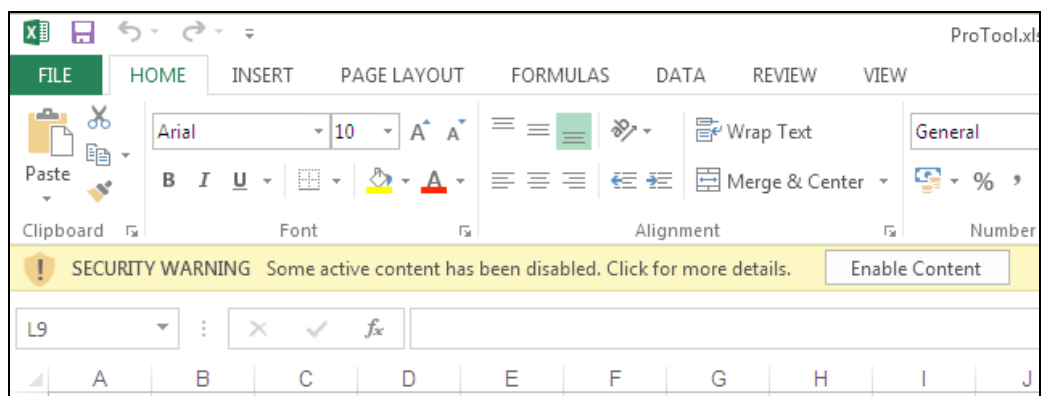

Just click on the “Enable Content” button, and it should continue to run smoothly. After a few seconds, you should see the normal ITTO ProTool screen as follows:

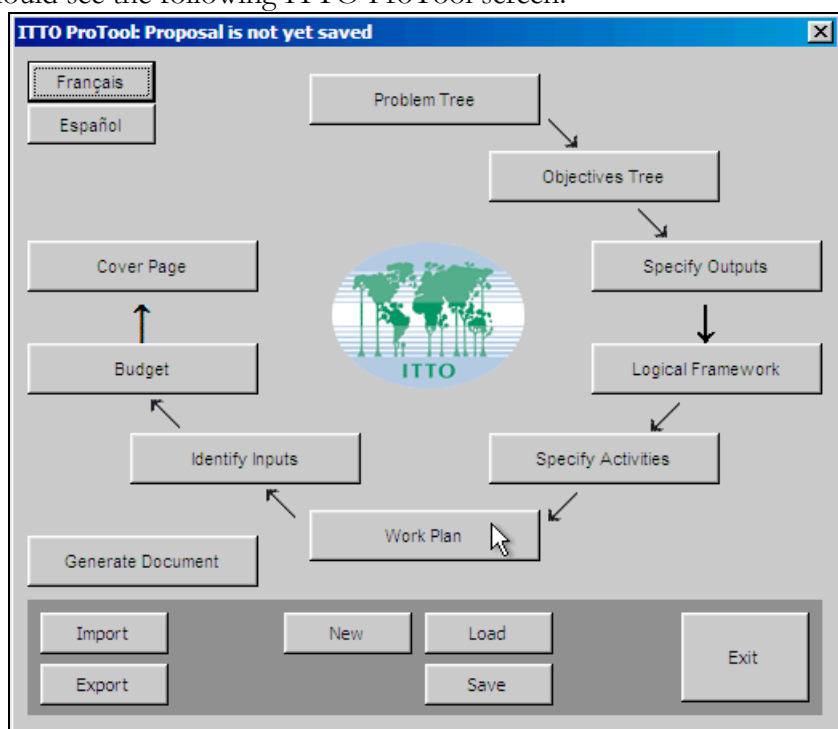

In Office 2010, you would need to click on the “Enable Content” button only after a fresh install. When running the software for the second time, it should not show the “Security Warning” message anymore.

For Office 2013 Users

After freshly installing the ITTO ProTool, and then running it for the first time, the following “Security Warning” message will show up:

Click on “Enable Content” button, and the software should run smoothly after that. After a few seconds, you should see the following ITTO ProTool screen.

The “Security Warning” message usually appears only on the first time the software is run. So when you run it for the second time, and so on, it should not appear anymore.

OK! That’s all for this new version!
