

**INTERNATIONAL TROPICAL TIMBER ORGANIZATION**

**ANNUAL REVIEW AND ASSESSMENT  
OF THE WORLD TIMBER SITUATION**

**2005**

This document supersedes document ITTC(XXXIX)/4 “Elements for the Annual Review and Assessment of the World Timber Situation 2005”. It presents updated and revised statistics of the world timber situation received during and following consideration of document ITTC(XXXIX)/4 by the International Tropical Timber Council in November 2005.

The designations employed and the presentation of material in this document do not imply the expression of any opinion whatsoever on the part of the International Tropical Timber Organization concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries.

Document GI-7/06. International Tropical Timber Organization. Yokohama, Japan.  
Prepared by the Division of Economic Information and Market Intelligence, ITTO.

## SUMMARY

This Review provides data on production and trade of tropical forest products and the status of tropical forests in ITTO member countries, as well as overview statistics of production and trade of all timber products in these countries. Data are presented up to and including 2005 based on projections or estimates mostly made in the third quarter of that year; these estimates should be viewed with caution due to the poor or missing data provided by many countries. 2004 is used as the base year for analysis and comparisons as this is the latest year for which reliable data for most countries were available at the time of preparation. Statistics comparing tropical to all timber production and trade for all 59 ITTO member countries in 2004 are given in Table 1.

### Production

Production of tropical industrial roundwood (logs) in ITTO producer countries totalled over 128 million m<sup>3</sup> in 2004, a 1.5% decrease from 2003. Log production increased to 131 million m<sup>3</sup> in 2005. Tropical log production was equivalent to 11% of total industrial roundwood production from all forests in all ITTO member countries in 2004. The proportion of logs domestically processed in Africa increased slightly from 80% in 2004 to 82% in 2005. The Asian figure for domestic log processing averaged 92% over the same period. This reflects larger populations/domestic demand, growing economies and the emphasis on producing and exporting value-added products in this region. Latin American countries continued to process virtually all tropical logs harvested in 2004-2005.

Tropical sawnwood production by ITTO producers totalled nearly 41 million m<sup>3</sup> in 2004, a 4% increase from 2003 levels. In 2005 sawnwood production rose to 41.3 million m<sup>3</sup>. Tropical hardwood veneer production in producer countries dropped by 14% to 2.9 million m<sup>3</sup> in 2004. This was due mainly to sharp declines by Côte d'Ivoire, Gabon and Indonesia.

Production recovered by nearly 5% to 3 million m<sup>3</sup> in 2005, due primarily to production increases in the Philippines and Gabon. ITTO producer countries' tropical plywood production decreased by 5.2% in 2004 to 14.4 million m<sup>3</sup>. This was due mainly to a decrease in Indonesia, which in 2004 ceded its position as the world's largest producer of tropical plywood to Malaysia. Plywood production in producer countries was 14.5 million m<sup>3</sup> in 2005.

ITTO consumer countries also produced substantial quantities of tropical timber products in 2004. China (2.7 million m<sup>3</sup>) and Australia (80 000 m<sup>3</sup>) together produced an estimated total of 2.8 million m<sup>3</sup> of logs from their tropical regions. Consumer countries produced just over 1.8 million m<sup>3</sup> of sawnwood, nearly 0.9 million m<sup>3</sup> of veneer and 6.3 million m<sup>3</sup> of plywood in 2004, all (with the exception of China and Australia) from imported tropical logs. ITTO consumer countries' production levels of all tropical timber products but plywood were stable or increased in 2005.

### Imports

Tropical log imports by ITTO consumer countries declined by 6% to 11.9 million m<sup>3</sup> in 2004 due to a 9% reduction in China's imports, which fell for the first time in over a decade. However, log imports increased by 1.2% in 2005 to nearly 12 million m<sup>3</sup> due to an increase in Japanese tropical log imports. China (still the world's top tropical log importer) maintained imports at 7.3 million m<sup>3</sup> in 2005. If imports by producing members are taken into account, total 2004 tropical log imports by ITTO members were 15.6 million m<sup>3</sup>, 3.1% less than in 2003.

The 2004 total log import figure is nearly 3.5 million m<sup>3</sup> higher than total ITTO exports, with this gap decreasing to around 3.4 million m<sup>3</sup> in 2005. This balance is presumably provided by non-ITTO log suppliers, although under-reporting

**Table 1. ITTO Summary Statistics (2004, millions)**

	Logs			Sawnwood			Veneer			Plywood		
	All	Tropical	(%)	All	Tropical	(%)	All	Tropical	(%)	All	Tropical	(%)
Production (m <sup>3</sup> )	1 200.2	131.1	(11)	334.2	42.5	(13)	10.2	3.7	(36)	63.9	20.6	(32)
Imports (m <sup>3</sup> )	111.3	15.6	(14)	117.1	11.1	(9)	5.2	1.3	(25)	22.7	10.9	(48)
Imports (\$)	11 100.4	3 127.0	(28)	27 490.9	3 795.7	(14)	2 850.0	671.9	(24)	9 205.3	4 333.5	(47)
Exports (m <sup>3</sup> )	51.1	12.1	(24)	96.1	10.9	(11)	40.8	1.1	(3)	21.0	10.4	(50)
Exports (\$)	4 801.7	1 431.9	(30)	23 865.5	3 227.8	(14)	2 643.3	691.5	(26)	7 870.7	3 723.8	(47)

of log exports, misclassification of imports, smuggling and/or statistical errors can also contribute to such gaps. Major non-ITTO tropical log suppliers include Equatorial Guinea and the Solomon Islands, with exports estimated to average over 400 000 m<sup>3</sup> per year each.

Japan's imports of tropical logs decreased 9% to 1.6 million m<sup>3</sup> in 2004, but increased 5% in 2005. Despite this increase, Japan's imports have still nearly halved in the past decade due to its contracting economy, reduced supplies from Malaysia, competition from China for available log supplies, and its increasing reliance on softwood logs for plywood manufacture. India, on the other hand, is now ITTO's second largest importer of tropical logs with imports up by 9% to over 3 million m<sup>3</sup> in 2004. India, Thailand and the Philippines are the major ITTO producer country log importers, accounting for 94% of total producer imports of 3.8 million m<sup>3</sup> in 2004. Both Thailand and the Philippines increased log imports in 2005, while India's were estimated to have remained stable.

China also continued as the world's largest tropical sawnwood importer in 2004, up 4% to nearly 3 million m<sup>3</sup>. Thailand's imports (which more than halved in the Asian crisis of 1998) also increased by 30% to 1.8 million m<sup>3</sup> in 2004, returning to pre-crisis levels. Japan's imports of tropical sawnwood decreased 23% to 378 000 m<sup>3</sup> in 2004, but increased 15% to 434 000 m<sup>3</sup> in 2005. Imports of tropical sawnwood by all consumer countries increased by 5.9% in 2004 to 7.7 million m<sup>3</sup> and remained stable in 2005. Increased imports by producers led total ITTO tropical sawnwood imports upwards by 7% to 11.1 million m<sup>3</sup> in 2004. Total imports decreased to 10.6 million m<sup>3</sup> in 2005 due to declines in consumer country markets.

Total ITTO tropical veneer imports decreased nearly 10% to 1.3 million m<sup>3</sup> in 2004, but increased by 12.4% to over 1.5 million m<sup>3</sup> in 2005. Korea remained the largest ITTO tropical veneer importer in 2004, with 236 000 m<sup>3</sup>. Korea's imports were stable in 2005. Mexico became ITTO's second largest tropical veneer importer in 2004, overtaking China and even with Taiwan P.O.C. with 175 000 m<sup>3</sup>, although the sources of these imports are unclear. Mexico's imports increased sharply in 2005. Meanwhile, China's imports fell sharply by 23% in 2004 to 98 000 m<sup>3</sup> and remained stable in 2005 as it met its veneer needs increasingly via production from imported tropical logs. The EU absorbed 357 000

and 345 000 m<sup>3</sup> of tropical veneer in 2004 and 2005, over one-fifth of total ITTO imports. Japan imported 44 000 m<sup>3</sup> of tropical veneer in 2004, a 10% increase from 2003 levels, before declining by 5% in 2005 to 42 000 m<sup>3</sup>. Formerly a major tropical veneer importer, Japan is now less significant than producer countries like the Philippines and Mexico.

Tropical plywood importers are led by Japan with nearly 4.6 million m<sup>3</sup>, a 38% increase from depressed 2003 levels which fell due to new product safety standards. Imports continue to replace domestic production of tropical plywood in Japan due to reduced availability of tropical peeler logs and relatively low prices of imported plywood. Japan's imports made up 41% of total ITTO imports of nearly 11 million m<sup>3</sup> in 2004. Tropical plywood imports by ITTO members remained stable in 2005.

## Exports

ITTO producer countries exported nearly 12 million m<sup>3</sup> of logs worth \$1.6 billion in 2004, with Malaysia (the largest exporter) providing just over one-third of this volume, down from almost three-quarters of the ITTO total in the early 1990s. Producer log exports in 2004 were down 8% from 2003 levels and fell further to 10.9 million m<sup>3</sup> in 2005, well under half the level exported just over a decade ago. Sawnwood exports by producer members jumped by nearly 31% to 10.5 million m<sup>3</sup> (worth \$2.2 billion) in 2004, remaining stable in 2005. Exports from the Latin American and Asia-Pacific regions fluctuated in 2004 and 2005, with African exports following a steady upward trend. Sawnwood exports from Malaysia increased by 10% to 2.8 million m<sup>3</sup>, benefiting from an Indonesian export ban. Veneer exports from ITTO producer countries increased by 8.1% in 2004 to slightly over 1 million m<sup>3</sup>, worth \$491 million, increasing a further 25.1% in 2005. Tropical plywood exports by producer members in 2004 declined by 1.8% to just under 9 million m<sup>3</sup>, worth nearly \$3.1 billion, with Malaysia (4.3 million m<sup>3</sup>) and Indonesia (3.1 million m<sup>3</sup>) accounting for 71% of this total. As for production, 2004 marked the first year when Malaysia's plywood exports exceeded those of its neighbor. Indonesia's exports remained stable in 2005, but Malaysia's increased to almost 4.7 million m<sup>3</sup>.

ITTO consumer countries also exported or re-exported substantial quantities of tropical timber in 2004, led by sawnwood and plywood

exports of 481 000 m<sup>3</sup> (worth \$332 million) and 1.5 million m<sup>3</sup> (\$617 million) respectively. Log and veneer exports were smaller (126 000 m<sup>3</sup>/ \$55 million and 130 000 m<sup>3</sup>/\$204 million respectively in 2004). Exports of tropical plywood by consumers increased slightly in 2005, while log, sawnwood and veneer exports declined. Growth of China's tropical plywood exports has been rapid and notable, reaching 959 000 m<sup>3</sup> in 2004 (up 69% from 2003 levels), and increasing a further 4% in 2005 to 1 million m<sup>3</sup>. Brazil remained the third largest exporter of tropical plywood in 2004, but China almost certainly overtook it in 2005.

## Prices

Prices for most primary tropical timber products and species kept strengthening during 2005, as supply of raw materials worsened, global economies expanded and consumer confidence improved in most markets.

African log and sawnwood prices, except sapele, held on to gains made in 2004, with some species reaching new record highs in 2005. African logs and sawnwood products, which are generally priced in euros, are recovering competitiveness due to a weaker euro and as prices for South East Asian products quoted in US dollars are rising. Price gains were also due to combinations of the following factors: shortages in supply of certain species; political unrest in Côte d'Ivoire and Liberia; the on-going UN Security Council embargo against Liberian exports; bans on exports of 20 primary species in Cameroon; tax increases in several countries; shipping bottlenecks; and rising freight rates. Price increases were moderated, however, by dull demand in the European market. West African producers fear that once Gabon's SNBG ceases its price leadership role in 2006 prices for okoume and ozigo logs could become volatile.

Log prices for some South East Asian species rose to 8-year highs in 2005 due to tighter supply of Asian logs heightened by crackdowns on illegal logging, restrictions on log exports and reduced logging quotas in Indonesia. This rise was also the result of active buying from China and India despite some resistance to higher prices by buyers in Japan. Despite these significant gains, Asian tropical log prices (with the significant exception of meranti) have still not recovered to the pre-crisis levels of early 1997. Price gains also continued in 2005 for rubberwood logs for domestic consumption in

Malaysia's export oriented furniture sector following the decision to ban exports of rubberwood raw materials in 2004 to ensure supplies for the domestic furniture, MDF and particle board industries. Soaring prices of natural rubber has also resulted in reduced rubberwood supply due to a slowdown in replanting.

Prices for most Asian and African tropical sawnwood species were stable or declined slightly in 2005. Iroko and meranti, however, managed to reach new record highs in the first half of the year. In spite of various restrictions on supply, including the ban on logging of mahogany in Brazil and its inclusion in CITES Appendix II in late 2003, and the halt in iroko log exports from Côte d'Ivoire, sawnwood prices remained depressed due to sluggish demand in the EU. The USA continued as the major market for export khaya (also known as African mahogany) as the supply of South American mahogany, strongly favoured by US consumers, remained extremely limited. Prices for Latin American tropical sawnwood rose during 2005 due to the restricted export quota for mahogany in Peru and price corrections in Brazil as a result of the strengthening of the real.

There is increased interest in African tropical sawnwood from major buyers, particularly from South Africa, who are switching away from Malaysia as prices for meranti sawnwood remain firm due to log shortages and the export ban imposed by Indonesia on sawn timber in September 2004. The reduction of import tariffs in India was stimulating demand for sawnwood there. The EU continues to increase imports of sawnwood and further processed tropical products at the expense of logs and to shift manufacturing to countries in Eastern Europe in order to lower production costs that have risen with the euro's appreciation and shortened EU working hours.

Prices for Asian plywood continued rising in 2005, reflecting continuous shortages in log availability and tighter control of illegal logging in Indonesia and elsewhere. Even higher prices were prevented by subdued consumption and continued deflation in Japan, still the world's largest tropical plywood consumer and fierce competition from Chinese plywood. Indonesia's market share in Japan shrank to less than 40% in 2005, while Malaysia's has risen to 48%. Due to limited supply, Indonesian plywood continued to lose market share in Europe to Chinese "combi" plywood products with poplar or bintagor cores. Chinese plywood products will continue gaining

ground in Europe and other major markets as the long-term trend is towards declining availability from Indonesia. In addition, several importers have been searching for alternatives to Indonesian plywood due to concerns over illegal logging despite some improvements in controls. In late 2005 the EU was preparing to implement a licensing (“FLEGT”) scheme to certify the legality of timber imported from exporting countries that volunteered to participate in the scheme. Indonesia was expected to be one of the first to participate in this scheme.

Prices of Brazilian plywood continued rising in 2005 thanks to strong demand in the USA and UK. Prices of these products rose sharply from September due to reconstruction following Hurricane Katrina in the southern USA. However, the impact of Katrina on prices is expected to be short-lived. With Brazil becoming the largest supplier of softwood plywood to the huge US market (well ahead of Canada), the product lost its duty free status in mid-2005. Most buyers in Europe were refraining from placing additional orders for Brazilian plywood due to the substantial price increases in 2005. European buyers were sourcing alternative plywood grades from elsewhere in Europe and from China. Brazil is facing stiff competition from Chinese plywood exporters, which, with a more favourable exchange rate and low production costs, have managed to make inroads in Europe and the USA at more competitive prices.

## **Secondary Products**

Exports of secondary processed wood products (SPWP) by ITTO producers continued their upward trend in 2004. Except 2001, when exports contracted 11% due mainly to a slowdown in the US market, exports of SPWP by these countries have been expanding steadily since ITTO started regularly tracking them in the mid-1990s. Exports jumped by 23% in 2004 to reach almost \$9.9 billion, led by increases in Indonesia’s, Malaysia’s, Brazil’s and Thailand’s exports. Indonesia and Malaysia were the only ITTO producer countries among the world’s top SPWP exporters. The top five ITTO producer country exporters of SPWP in 2004 (Indonesia, Malaysia, Brazil, Thailand and Mexico) accounted for 88% of total ITTO producers’ SPWP exports. Indonesia and Malaysia continued consolidating their positions as two of the world’s largest SPWP exporters in 2004 with 12% and 20% jumps in exports, respectively. Malaysia is soon

set to overtake the USA as the world’s eighth largest SPWP exporter. Brazil’s SPWP exports also continued to boom, surging 51% in 2004. Brazil overtook Thailand as the third largest tropical exporter of SPWP in 2003 and is rapidly approaching Malaysian export levels and poised to join it as one of the world’s top SPWP exporters. Most Brazilian export furniture is made from solid pine and reconstituted panels.

China continued its spectacular growth in SPWP exports in 2004, and remains the most formidable competitor of most ITTO producer exporters. In 2000, China overtook Thailand as Japan’s largest supplier and Canada as the world’s second largest exporter after Italy. China’s exports surged by 24% in 2003 to almost \$7.5 billion, overtaking Italy as the largest global exporter of SPWP. Chinese SPWP exports climbed another 27% to over \$9.5 billion in 2004, consolidating it as the world’s largest SPWP exporter. China’s rapid expansion has been due largely to its booming exports of wooden furniture to the USA and Japan, despite anti-dumping duties imposed on bedroom furniture by the USA in 2004. This growth is expected to continue as more companies from the USA, Taiwan Province of China and other Asian producers continue to establish SPWP joint ventures in Southern China because of its low costs.

Japan and the USA remained the two largest markets for SPWP from ITTO producers, with such products making up 31% and 22% of their total SPWP markets respectively in 2004. However, these shares have declined (from 35% in Japan and 25% in the USA) since 2000, primarily due to competition from China. The USA is the main partner of ITTO producers in value terms (\$4.8 billion in 2004) and its market continues to be the engine driving SPWP (mainly furniture) trade, growing almost four-fold in the last decade and up by 52% in the five years to 2004. Although ITTO producer countries accounted for only 11% of the total EU market for SPWP in 2004, the magnitude of this huge market meant that the value of this share (\$2.9 billion) was 1.5 times the value of their Japanese market share and 61% of the value of their share of the US market. In 2004, imports of SPWP by ITTO consumers from ITTO producers were worth a record \$9.4 billion, equivalent to an estimated 93% of the value of their imports of primary tropical timber products from these countries.

# 1. INTRODUCTION

## Overview

This report reviews developments in the global timber sector and wood markets, with a focus on tropical timber, in 2005. It contains data series on production and trade for 2001-2005, with a focus on the past three years. 2004 is used as the base year for all global comparisons and ITTO summary totals as this is the latest year for which reasonably reliable data for most countries were available at the time of preparation.

China's imports continued to drive the tropical log market despite falling back in 2004. Many of China's tropical log imports are converted to plywood, with the country now the world's third largest exporter of this product. Japan's tropical plywood imports increased sharply in 2004, but domestic production is plummeting along with tropical log imports, while coniferous plywood imports and production steadily increase. Many producer countries continued their shift from primary to secondary processed wood products exports in 2004, with trade in these products continuing to rise toward the level of primary tropical timber products trade.

ITTO continued to participate actively in the work of the UN Forum on Forests (UNFF) in 2005 and the Collaborative Partnership on Forests (CPF) established to facilitate its work. The Organization undertook missions to several member countries to promote sustainable forest management in 2005. ITTO also continued to strengthen its collaboration with the various processes aimed at establishing criteria and indicators for ascertaining the status of forest management (Montreal, Tarapoto, ATO etc.). ITTO convened a further four national level field training workshops to encourage forest management unit level reporting based on its Criteria and Indicators for the Measurement of Sustainable Management of Tropical Forests in 2005. These were attended by over 150 forest concessionaires and related forest managers. ITTO also continued work on forest law enforcement (FLE) in 2005, collaborating with FAO to publish "best practices" for forest law enforcement. Full reports on all these activities are contained in separate reports to the Council or available from the Secretariat. Two notable reports, ITTO's *Status of Tropical Forest Management 2005* and FAO's *2005 Forest*

*Resource Assessment* were close to publication at the end of 2005 and will be summarized in next year's Review.

Partly due to concerns over FLE and legality of timber supplies, timber certification remained a topical issue in 2005. Forestry operations in many countries were seeking some form of certification, either through the Forest Stewardship Council (FSC) or the Programme for the Endorsement of Forest Certification Schemes (PEFC), or via other avenues (e.g. ISO 14000, national standards authorities, etc.). Tropical countries are increasingly developing national schemes, led by Malaysia's national Timber Certification Council (MTCC) and Indonesia's ITTO-supported Ecolabelling Institute (LEI), both of which marketed certified tropical forest products under their own labels in 2005. Several other tropical countries are seeking support from ITTO and others for the development of national certification schemes. The proliferation of national schemes has led to numerous calls for a framework for mutual recognition between schemes and ITTO has been active in attempting to facilitate agreement on such a framework, as well as promoting phased approaches to certification that recognize progress towards meeting certification goals in countries still in transition to SFM. A detailed summary of recent developments in timber certification is included in the ECE Timber Committee's Forest Products Annual Market Review, 2005-2006 (see Appendix 6).

Many other relevant developments have occurred in 2005 in ITTO member countries. This Review attempts to summarize some of these in relation to their impacts on the production and trade of tropical timber.

## Scope and Structure

This Review includes data appendices on total timber production volumes and trade volumes/values for all ITTO members. These data are included to assist placing tropical timber in a global context, as called for in the ITTA (1994). However, as recommended by the 1997 Technical Working Group on ITTO's Statistical Functions, the focus of the Review remains on tropical timber. The Review consists of four substantive chapters. The first chapter summarizes

developments in major markets for tropical timber. This chapter includes a discussion of current and projected economic conditions in many countries. The second chapter provides an analysis of production, consumption, trade and prices for the primary tropical timber products covered by the ITTA (tropical logs, sawnwood, veneer and plywood). Data on production and trade of pulp and paper and reconstituted panels in tropical countries could not be processed this year due to resource constraints and will be resumed in the 2006 Review. A third chapter describes trade in secondary processed wood products (SPWPs) with a focus on tropical countries where these products are playing an ever greater role. The final chapter of the Review provides brief notes of relevant trends and developments in ITTO member countries not covered elsewhere.

### **Data Sources and Limitations**

Statistics in the Review have been derived from members' responses to the 2005 Joint Forest Sector Questionnaire (JQ) wherever possible; the JQ can be downloaded from the ITTO website ([www.itto.or.jp](http://www.itto.or.jp)) and includes definitions of all products covered here. ITTO is responsible for sending the JQ to all of its producer members, plus Japan, while responses from other consumer members were forwarded from JQ partner agencies (UN-ECE, Eurostat and FAO). The number of countries responding to the 2005 JQ was down by one from the response level in 2004. Only 25 of 33 producer countries (27 of 33 in 2004) responded, while all consumer countries (25 of 26 in 2004) provided at least partial responses. Brazil, Central African Republic, Democratic Republic of Congo, Fiji, Liberia, Nigeria, Papua New Guinea and Vanuatu did not respond to the 2005 JQ or numerous follow-up queries.

Unless otherwise noted, all value units quoted in this Review are in nominal US dollars, while volumes are reported in cubic meters. "Tropical timber," as specified in the ITTA (1994), includes only tropical hardwood saw and veneer logs, sawnwood, veneer and plywood. This Review includes tropical softwoods (coniferous species), which are of growing importance to many countries, in the figures given for all timber.

As trade figures for saw and veneer logs are impossible to collect from existing customs classification systems, which do not distinguish between different types of industrial roundwood,

figures for log trade and production given in the Review now refer to total industrial roundwood. Products such as pulp and paper and reconstituted panels (not included in the ITTA definition of tropical timber) have been included in the analysis as they are important components of forest production and/or trade in several tropical countries.

Estimates of trade figures for Hong Kong and Macau Special Administrative Regions have been largely based on UN COMTRADE data (if available) and for Taiwan Province of China, the Bureau of Foreign Trade since none of the three provide statistics directly to ITTO. Trade flow statistics for many developed countries were also derived from COMTRADE (or the corresponding EU database, COMEXT) since most developed countries do not complete the direction of trade tables in the JQ. This often causes difficulties when the aggregate totals given by the countries in the JQ do not coincide with the corresponding trade figures reported in these databases.

As in previous years many of the statistics that were received from members via the JQ contained significant and obvious errors in one or more data categories. Only 11 producer and 15 consumer members met the 15 August 2005 deadline for responding to the JQ and some of the remaining 25 responses only arrived at ITTO Headquarters as late as April 2006, allowing insufficient time for analysis and to request/receive clarifications where necessary. Table 2 shows a breakdown of responses to the JQ, illustrating the problems that many countries still have in providing information to ITTO and providing a subjective indicator of the quality of the data on which this Review is based.

Many members substantially revised statistics for 2003-2004 submitted in the 2005 JQ from those submitted in previous years. This, together with the detection of errors, resulted in several modifications and amendments to statistics, so the data series presented here can differ (sometimes substantially) from those in previous editions of the Review.

Several supplementary sources were consulted to verify members' responses to the JQ, to fill in incomplete or obviously incorrect responses and to provide data for non-responding countries. These supplementary sources are listed in the References as well as in the notes preceding the

Table 2. Data Quality Indicators	
<u>No responses:</u> (8 of 59 countries)	Brazil, Central African Republic, Democratic Republic of Congo, Fiji, Liberia, Nigeria, Papua New Guinea and Vanuatu.
<u>Good responses:</u> (17 of 51 countries)	Côte d'Ivoire, Denmark, Finland, France, Germany, Japan, Myanmar, Netherlands, New Zealand, Panama, Peru, Republic of Congo, Spain, Sweden, Suriname, Trinidad and Tobago, and USA. <ul style="list-style-type: none"> <li>• All major sections complete</li> <li>• Internally consistent (material balance, year on year trends, unit values, compatibility between tables)</li> <li>• More or less consistent with trade partner reports</li> </ul>
<u>Incomplete or erroneous responses:</u> (34 of 51 countries)	<ul style="list-style-type: none"> <li>• Tropical trade data missing or unusable: 5 of 16 Consumer responses</li> <li>• Tropical production data missing or unusable: 8 of 16 Consumer responses</li> <li>• Production data missing or unusable: 8 of 18 Producer responses</li> <li>• Tropical species trade data missing or unusable: 8 of 18 Producer responses; 11 of 16 Consumer responses</li> </ul>

Appendices. Estimates of production and trade were, where possible, derived for incomplete responses and non-responding countries based on direction of trade statistics reported by trading partners, information on processing capacity (if available) and the other sources listed. Comparisons with global totals or totals for all tropical countries for primary products are based on statistics from the FAOSTAT database, the latest summary of global forest statistics available. All other data used in the preparation of the Review are compiled in Appendices 1 - 5.

Most members that responded to the 2005 JQ reported at least some categories of data for both 2003 and 2004. Many members failed, however, to report any partial year data or forecasts for 2005; caution should therefore be used when interpreting the estimates for these countries and the ITTO totals for 2005 given here. Countries for which estimates were made (or alternate sources used) are identified by the superscripts used in the Appendices.

Despite the best efforts of the Secretariat to ensure data consistency and accuracy it should be noted that considerable discrepancies exist between available data sources in many categories, for both producing and consuming countries. The final statistics compiled for presentation here are the result of analysis and synthesis of the available data sources by the Secretariat, and of consultations with member countries and other agencies.

The assistance of those countries which responded to the 2005 Joint Forest Sector Questionnaire is gratefully acknowledged, as is the support of the FAO Forestry Department, the UN-ECE Timber Section, Eurostat Unit F-1, the United Nations Statistical Office, the Japan Lumber Importers' Association, the Japan Plywood Manufacturer's Association and the ITTO Market Information Service in providing relevant primary and supplementary data for the Review.

## 2. MARKET DEVELOPMENTS

This chapter provides a brief analysis of general developments in tropical timber markets as well as an overview of tropical timber trade in 2004-2005. The analysis is based on responses to the JFSQ submitted by members, International Monetary Fund (IMF) statistics and a review of other available literature.

### Economic Trends

In late 2005, the IMF reported that global output (real GDP) grew by 5.1% in 2004, up from the 4% achieved in 2003 and the highest for nearly three decades. The global economy continued recovering from the slowdown in all major economies in 2001 (when growth fell to 2.4% from 4.7% in 2000). The global economic recovery slowed down in 2005, when the IMF projected global growth had declined to 4.3% due to higher oil prices. Global economic growth was expected to remain the same in 2006. Figures 1 and 2 summarize the trends for the main ITTO consumer and producer countries/regions discussed here.

In 2004, GDP of all developing countries grew by 7.3%, well above the 3.3% growth achieved in advanced economies and the 5.6% growth in newly industrialized Asian economies (NIEs, which include Hong Kong S.A.R., Republic of Korea, Singapore and Taiwan P.O.C.). Growth in the NIEs, which fell sharply during the global economic slowdown (from 7.9% in 2000 to 1.3% in 2001), slowed in 2005 to 4%. The global economic expansion in 2004 drove growth up in Asia, Africa and the Western Hemisphere. These regions all grew by 6.4% in 2005. The IMF expects output in developing countries to grow by 6.1% in 2006, above the 2.7% growth expected in advanced economies.

World trade volume (exports plus imports) continued improving in 2004 when it surged by 10.3%, up sharply from 5.4% in 2003 and well above the average growth over the past decade and during the 1980s. Trade growth slowed in 2005, but still expanded by a solid 7%. World trade growth is projected to accelerate to 7.4% in 2006. Both developed and, particularly, developing countries contributed to the surge in trade growth in 2004, with both exports and imports expanding. The deceleration in world trade in 2005 was likewise due to lower trade volumes by both developed and developing

countries. Average non-fuel primary commodity prices (US\$) climbed by 18.5% in 2004, due mostly to the depreciation of the US dollar and buoyant global demand, particularly in China. Average non-fuel primary commodity prices rose a further 8.6% in 2005. However, the average price of these commodities is projected to contract by 2.1% in 2006 in anticipation of slowing global growth, particularly in China. After remaining almost flat or declining slightly from the mid-1990s to 2001, average primary commodity prices appear set to resume a gradual long-term downward trend despite the strong surge in 2003-2005.

Most EU economies under-performed the average growth rate of 3.3% for all advanced economies in 2004, with an aggregate increase in real GDP of 2%, rebounding from a mere 0.7% in 2003. EU economic growth slowed to 1.2% in 2005 and was projected by the IMF to remain low at 1.8% in 2006. The German economy (which comprises one-third of the EU total), still recovering from reunification costs and high unemployment that slowed growth for much of the 1990s and early 2000s, expanded by 1.6% in 2004. German growth slowed to 0.8% in 2005 and a projected 1.2% in 2006.

The economies of the Netherlands and Portugal also recovered from near recessions in 2003, rebounding by 1.7% and 1% in 2004, respectively. The Dutch economy was helped in particular by the economic recovery in its largest trading partner, Germany.

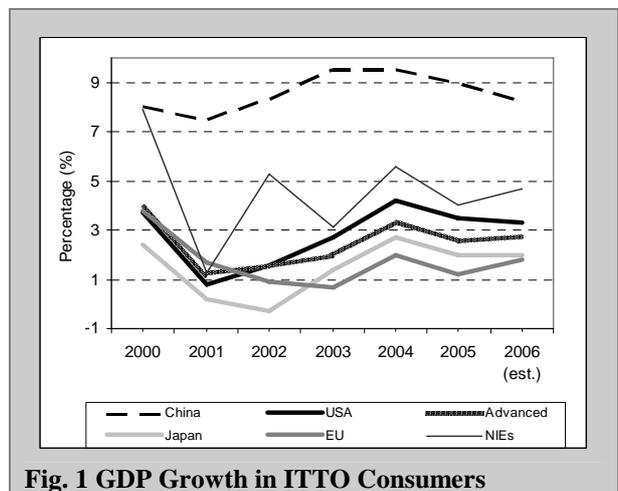

Fig. 1 GDP Growth in ITTO Consumers

The UK economy grew by 3.2% in 2004, well above average growth of recent years. The UK's

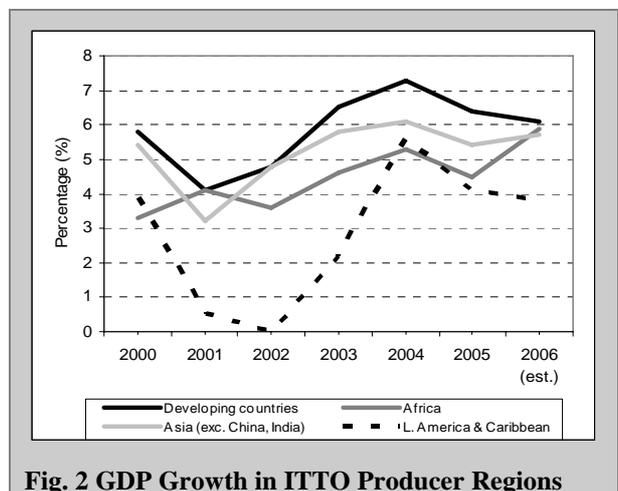

economy slowed to 1.9% in 2005 and was projected to grow 2.2% in 2006. The economies of France and Italy, which lagged between 2000 and 2003, with growth below average levels for the last decade, rebounded in 2004. In France, GDP growth surged to 2% in 2004 before slowing to 1.5% in 2005 and to a projected 1.8% in 2006. Italy's growth rebounded to 1.2% in 2004, up from 0.3% in 2003. Italy's economy stagnated in 2005, and was projected to rebound by 1.4% in 2006.

With a healthy 4.2% increase in 2004, the United States economy drove up the average growth rate for all advanced economies from 1.9% in 2003 to 3.3% in 2004. This is in contrast to 2001, when the US economy slowed sharply, growing by under 1%, the lowest growth rate in the past two decades. Its growth slowed to 3.5% in 2005 and to a projected 3.3% in 2006. The on-going positive outlook for the US economy follows rising domestic consumption and tax cuts that helped export growth. US inflation rose to 2.7% in 2004, up from 2.3% in 2003. Inflation surged to 3.1% in 2005, well above the average of the last decade. US inflation was projected to fall to 2.8% in 2006. Continued increases in inflation (and accompanying increases in interest rates), together with large current account and trade deficits may combine in the near future to dampen the relatively strong US growth of recent years. Unemployment in the USA fell to 5.5% in 2004 from 6% a year earlier, but still above the average (5%) of this decade. Unemployment retreated further to 5.2% in 2005, and is expected to remain the same in 2006.

The Japanese economy continued to recover in 2004, with GDP growth of 2.7% after a recession in 2002 when the economy shrank by 0.3%. This recovery was amid increasing signs that long-standing problems (deflation and financial and corporate sector weaknesses) were easing. Deflation is receding with consumer prices remaining stable in 2004 (as opposed to an annual average decrease of 0.1% in the last decade), while unemployment declined to 4.7% (albeit still almost double the annual average in the 1987-1996 period). Unemployment declined further to 4.3% in 2005. Export volume jumped 14.5% in 2004, almost three times the average over the last decade. Exports surged a further 5.4% in 2005, contributing to GDP growth of 2% that year. Recent signs that Japan is emerging from deflation lead to projected growth of around 2.8% in 2006.

China's economy continued its rapid growth in 2004 and 2005, expanding by over 9% in both years to lead all major economies. China's housing policy is changing to encourage private ownership over state-sponsored accommodations, with potentially major implications for housing starts and wood demand. The home mortgage market is growing rapidly and sales of residential homes have increased by 40-50% per year since 1999. Timber-framed houses are still only a small fraction (<1%) of Chinese housing starts, but demand is steadily increasing. There is also a nascent but rapidly growing home renovation (DIY) sector in China which will contribute to increased wood consumption. China's growth is projected to continue to lead the world at over 9% in 2006.

Developing Asian countries (excluding China and India) also continued to grow strongly in 2004, with output increasing by 6.1%. Growth slowed to a still solid 5.4% in 2005 and a projected 5.7% in 2006. In Africa (sub-Saharan, excluding Nigeria and South Africa), growth jumped to 6.5% in 2004, from 3.6% in 2003. Growth slowed to 5.3% in 2004 and is expected to rebound to 7.4% in 2006 due to expected improvement in public finances, competitiveness and security conditions in several countries, as well as increased oil exports by some countries. In 2004, several Latin American economies continued to recover from 2002 recessions, with regional GDP growth jumping to 5.6%, double the average growth of the last decade. The recovery was primarily due to rebounds in the economies of Venezuela (up 17.9%, largely oil-driven), Argentina (9%), Brazil (4.9%) and Mexico (4.4%). Latin American economic growth slowed to 4.1% in 2005 and to a projected 3.8% in 2006, due to slightly slower growth in most countries.

**Fig. 2 GDP Growth in ITTO Producer Regions**

## Tropical Timber Markets and Trade

The direction of trade tables for 2004 in Appendix 2 were derived from responses to the 2005 Joint Forest Sector Questionnaire (JFSQ) and other sources listed in the notes accompanying the Appendices. Minor trade flows are not included in Appendix 2, with only the top twelve importers and exporters for each product included. These countries accounted for between 85-95% of total trade of the four products in 2004. Direction of trade statistics are not collected directly via the JFSQ from most consumer countries. Data for UN-ECE and other countries that didn't provide trade flows via the JFSQ was extracted from the UN COMTRADE or the Eurostat COMEXT databases where available. This often caused difficulties in the many cases where figures aggregated from these databases were significantly different from the total trade figures provided in the Joint Questionnaire.

Total values (US dollars) of 2002 and 2003 imports and exports by product are summarized in Appendix 1, together with unit values based on reported trade volumes. Value data is reported poorly or not at all by many countries. Values have in many cases been estimated using average unit values.

Many countries made errors or omissions in providing trade data, particularly by failing to distinguish tropical wood imports and exports from those of all timbers. Many countries also have serious problems in their customs statistics for tropical timber, with misclassification of imports and failure to count tropical species/products grouped in "Others" categories of customs classification systems common. If available, other data sources were used when data provided was obviously flawed. Entries in the tables of Appendix 2 consist of exporters' reports (*italicised*) and importers' reports (**bold**). The discrepancies which are illustrated by many of these entries can be due to a number of factors, as detailed in ITTO's studies of trade statistics discrepancies under Council Decision 6(XXXI). Carelessness or inadequate training of reporting officials or correspondents is often a prime reason; this can only be remedied with better training and supervision, particularly in the application of customs classification systems. Problems with consistency in conversion factors (some countries report weights and/or surface areas instead of volumes) and/or product definitions can explain some discrepancies. Also, different scaling or measurement systems are

sometimes used in different countries. Definitions of the reporting period may differ from exporter to importer, or shipments sent at the end of one period may not arrive until the following. Imports destined for re-export may not be correctly recorded, and (re-) exports of tropical timber from non-tropical countries may not be recognized as tropical by the importing country. Finally, timber theft as well as smuggling and transfer pricing to avoid tariffs, quotas and/or taxes have been documented for several tropical forest products and in several countries. It is clear that if ITTO is to fulfil its mandate to ensure greater transparency in the tropical timber market, major improvements in the collection and reporting of trade statistics are still required, in both producing and consuming countries. The sections on exports in this and the next chapter use exporters' reports unless stated otherwise; those on imports use importers' reports.

### *Exports*

The composition of primary tropical timber exports for 2002-2004 from the ITTO producing regions is shown in Table 3. The contribution of logs to total primary tropical timber exports of ITTO producers (in terms of both value and roundwood equivalent - rwe - volume) has fallen dramatically from over 60% in the 1980s to well under one-fifth in 2005. Only Africa continues to export a significant volume equivalent of logs compared to processed primary products, with log exports making up 17% of log production and 43% of total roundwood equivalent export volume in 2004. The Asia-Pacific region has replaced significant log exports with the export of processed primary products, spurred mainly by exports of sawnwood and plywood. Asian log exports made up just over a fifth of total primary product export volume in 2004 (under 12% of log production). Latin American tropical log exports are a small fraction of both production and total primary exports. Total roundwood equivalent export volume as a percentage of log production increased in all three regions from 15% to 19% in Latin America, 40% to 41% in Africa and 50% to 52% in Asia between 2003-2005. Total ITTO producer member exports (rwe) jumped over 6% (from 50.4 million m<sup>3</sup> to 53.6 million m<sup>3</sup> between 2003 and 2004, and remained stable in 2005). The increase in 2004 exports was due to increases in exports from Asia and Latin America. Levels of primary product exports from all three regions are complemented by increased exports of secondary products (SPWP), as detailed in Chapter 4.

Region	Log Production			Log Exports			Processed Exports			Total Exports		
	2003	2004	2005	2003	2004	2005	2003	2004	2005	2003	2004	2005
Africa	18 579	17 674	19 343	3 913	3 031	3 051	3 462	3 998	4 728	7 375	7 029	7 779
Asia-Pacific	75 147	74 096	74 836	8 877	8 604	7 524	28 601	30 900	31 390	37 478	39 504	38 914
Latin America	36 488	36 535	36 806	213	323	341	5 377	6 778	6 656	5 590	7 101	6 997
Total	130 214	128 305	130 985	13 003	11 958	10 916	37 439	41 675	42 774	50 442	53 633	53 690

Note: Totals may not sum exactly due to rounding.

### **Imports**

Table 4 provides an overview of the dependence of major ITTO importers on tropical wood products in 2003. Major importers are defined here as those with imports of at least 100 000 m<sup>3</sup> of one or more tropical products. Table 4 indicates in which products each country qualifies as a major importer by denoting the relevant figures in bold; only Korea and Taiwan P.O.C. qualify as major importers of tropical timber under this criterion in all primary product categories. Taiwan P.O.C. is the most dependent of the major ITTO consumer importers on tropical timber, with a significant proportion of its substantial log, sawnwood, veneer and plywood imports of tropical origin. Unsurprisingly, given

the dominance of tropical plywood in international plywood trade, several of the countries in Table 4 have a fairly high dependence on tropical plywood imports (although this dependence is decreasing in some cases), with China, Japan and Korea dependent on tropical sources for close to or over 90% of total imports. Tropical sawnwood has a lower market share in most non-tropical countries, with only China and Hong Kong S.A.R. dependent on it for around half of their total sawnwood imports. Only Portugal and Taiwan P.O.C. amongst major consumers reported imports of a greater proportion of tropical than non-tropical logs in 2004. Korea and Taiwan P.O.C. were the only major tropical veneer importers in 2004.

Consumer Members	Logs	Sawnwood	Veneer	Plywood
Australia	100.0	<b>16.8</b>	36.8	29.0
Belgium	0.9	<b>14.3</b>	25.0	<b>45.6</b>
China	<b>27.8</b>	<b>49.7</b>	64.1	<b>89.6</b>
France	<b>23.6</b>	<b>10.8</b>	61.6	24.5
Germany	5.1	<b>3.4</b>	16.7	<b>10.0</b>
Hong Kong S.A.R.	41.3	<b>51.3</b>	42.1	<b>77.1</b>
Italy	<b>5.0</b>	<b>4.7</b>	36.9	16.9
Japan	<b>12.8</b>	<b>4.1</b>	32.6	<b>88.8</b>
Netherlands	8.0	<b>14.2</b>	34.5	<b>36.5</b>
Portugal	<b>56.3</b>	<b>45.0</b>	41.3	43.5
Republic of Korea	<b>7.0</b>	<b>34.5</b>	<b>77.9</b>	<b>91.3</b>
Spain	<b>3.5</b>	<b>10.3</b>	29.5	7.5
Taiwan P.O.C.	<b>82.4</b>	<b>40.6</b>	<b>85.9</b>	<b>76.7</b>
U.K.	3.7	<b>2.7</b>	44.8	<b>13.0</b>
USA	0.1	<b>0.8</b>	5.3	<b>31.0</b>
<b>Producer Members</b>				
India	<b>91.2</b>	12.5	60.0	12.9
Malaysia	78.5	<b>88.9</b>	16.4	50.0
Mexico	1.0	<b>10.4</b>	<b>17.0</b>	<b>42.4</b>
Philippines	<b>83.1</b>	<b>44.5</b>	75.0	7.1
Thailand	<b>90.3</b>	<b>92.9</b>	100.0	<b>100.0</b>

Developments in several of the consumer countries in Table 4 will likely affect demand for tropical timber in the near future. The EU was developing a scheme in 2005 to restrict imports of timber to those legally sourced from volunteer partners under its “Forest Law Enforcement, Governance and Trade” initiative. In Japan, a new public procurement law for government funded construction will restrict timber imports for such purposes to legal sources.

In contrast to consumer countries, most of the major ITTO producer country importers in Table 4 (with the exception of Mexico which trades extensively with the USA) depend on tropical timber for a significant part of their imported wood needs. This is changing, however, with for example, India, Malaysia and the Philippines now sourcing substantial quantities of timber imports from non-tropical areas.

### 3. PRODUCTION, TRADE AND PRICES OF PRIMARY PRODUCTS

This chapter provides statistics on production and trade of primary tropical forest products in ITTO producer and consumer countries, as well as price trends for selected products. Appendix 6 contains the Market Statement released in October 2005 by the ECE/FAO Timber Committee, providing an overview of developments in important markets for non-tropical primary timber products.

#### Data Sources and Conventions

Data on production presented here has been derived from Joint Questionnaire returns and supplemented by other available data sources (see Appendix 1). Production statistics in many ITTO member countries are often weak or non-existent. The primary problem in many producer countries is the lack of a comprehensive forest outturn measurement system as well as any kind of regular industrial survey to obtain production figures, while many consumer countries are unable or unwilling to distinguish the processing of tropical timber from all timber processing. In several cases, production figures have been estimated by working backward from available log supply. Apparent domestic consumption (production plus imports minus exports) statistics do not include changes in stock levels, which in the past were generally not reported or reported incorrectly by countries and which are therefore no longer collected.

As in previous years, production figures for many countries (including important producers like Brazil, Ecuador, India and Indonesia) were either not provided or were unusable in 2005 and have been estimated from other sources and/or trade levels (if reported). Production figures for these countries should therefore be viewed with caution. Some countries (e.g. Honduras, Venezuela) include tropical softwoods in the production data reported to ITTO. Where distinguished, these products were included in the figures for all timber but not for tropical timber in Appendix 1. Several countries (e.g. Brazil, China, Indonesia) are reported by various sources to have high levels of “unofficial” industrial roundwood production. Unless estimates of such “unofficial” production could be independently verified, only official production figures are presented here.

The following sections also report on exports, imports and price trends of each of the four

primary tropical timber product categories covered by the ITTA. Detailed trade statistics are presented in Appendices 1 and 2, with data sources given in the notes preceding the Appendices. Major species in trade, together with volumes and average prices when these were reported, are summarized by country in Appendix 3.

Price trends through late 2004 for several important tropical log and sawnwood species and various grades and thicknesses of plywood from each exporting region are contained in Appendix 4 and serve as the basis for the price analyses presented here. Nominal prices were reported biweekly by the ITTO/International Trade Center Market News Service (MNS) from 1990 until the end of 1995, and have continued to be reported by the ITTO Market Information Service (MIS) from then onwards. The nominal price series from these sources were converted to real 1990 US dollars using IMF exchange rate series and the IMF Consumer Price Index (CPI) for industrial countries. Both nominal and real price trends are given in Appendix 4.

As not all species are reported regularly, and since the MIS has added coverage of new products/species, some price series commence later than 1990 and may have gaps. An attempt has been made to prepare price trend charts for a range of species/products identified as important in international trade. However, the products covered in the Review’s price trend analyses may change from year to year since some species may drop out of regular international trade due to export bans or restrictions. Details of species banned from export by individual countries are included in the Country Notes, where this data has been provided by members. Species are identified by internationally accepted pilot/trade and scientific names; the local names of timber species used by producer countries, where they differ from pilot/trade names, are given in Appendix 3.

Average prices for species/products traded in 2002-2003 are also included in Appendix 3 for those countries that provided this data in the 2005 Joint Forest Sector Questionnaire. No attempt has been made to adjust or verify these nominal prices. Finally, Appendix 1 contains the average

unit values of exports and imports for all products and countries in 2003-2004. These figures are highly aggregated based on total value and volume trade statistics and therefore include all species, grades and markets for each product. They are also, in many cases, based on estimates due to poor responses on trade values in the Joint Forest Sector Questionnaire.

## Industrial Roundwood

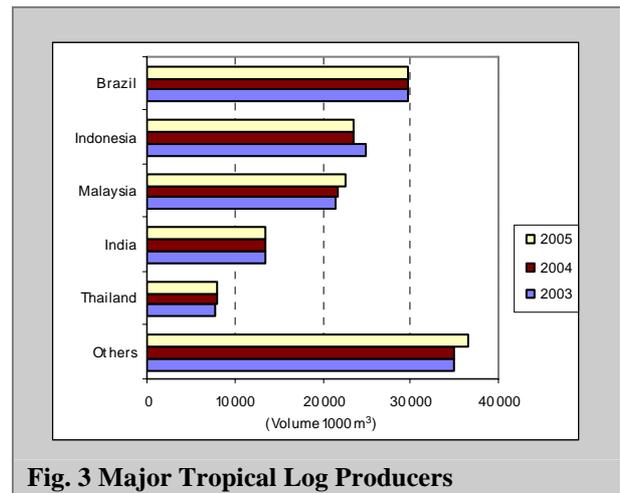

### Production

The production of tropical industrial roundwood (“logs”) in ITTO producer member countries fell to 128.3 million m<sup>3</sup> in 2004 (down from 130.2 million m<sup>3</sup> in 2003), before rebounding to almost 131 million m<sup>3</sup> in 2005. Figure 3 shows ITTO’s five major tropical log producers for 2003-2005, ranked by 2004 production, as well as aggregate production by all other members. Of the top five, only Indonesia significantly decreased production during the period 2003-2005. Malaysian production climbed to 22.7 million m<sup>3</sup> in 2005, up 27% from a low of 17.9 million m<sup>3</sup> in 2003. Malaysian log production is still less than half of the levels of the early 1990s. Brazil held log production stable at almost 30 million m<sup>3</sup> in 2005, well above official estimates from Indonesia, now the world’s second largest producer (and possibly still the largest if unofficial/illegal harvests are taken into account).

Figure 3 illustrates the dominance of the top four tropical log producing countries (Indonesia, Brazil, Malaysia and India) which together comprised almost three-quarters of total ITTO production in 2004-2005. Indonesian log production is probably significantly higher than the estimates given here, however, with some sources estimating the illegal harvest to be almost equal to or even greater than the estimated figures shown in Figure 3. Unfortunately, Indonesia, like Brazil and India, has never provided reliable official production figures to ITTO, necessitating the use of estimates based on reported exports and assumed domestic consumption. Thailand’s production is based almost entirely on its rubberwood and other plantation resources. Appendix 1 (Table 1-1-d) shows that four other ITTO producer members (Nigeria, Myanmar, Gabon and PNG) had log production exceeding 2 million m<sup>3</sup> in 2004. All of these except Myanmar remained stable or increased production in 2005.

Two ITTO consuming countries produced significant amounts of logs from their tropical

forest resources in 2004: China (2.7 million m<sup>3</sup>) and Australia (80 000 m<sup>3</sup>). China’s production increased from 2.2 million m<sup>3</sup> in 2003 and grew a further 5.1% in 2005. China’s increasing tropical log supply is due to the maturing of tropical plantations and an easing of its logging ban in southern provinces. The bulk of China’s production comes from its southern provinces of Hainan Island and Yunnan. Log production from these areas is consumed almost entirely domestically. Australia’s much smaller production is from north Queensland and is also consumed domestically.

**Fig. 3 Major Tropical Log Producers**

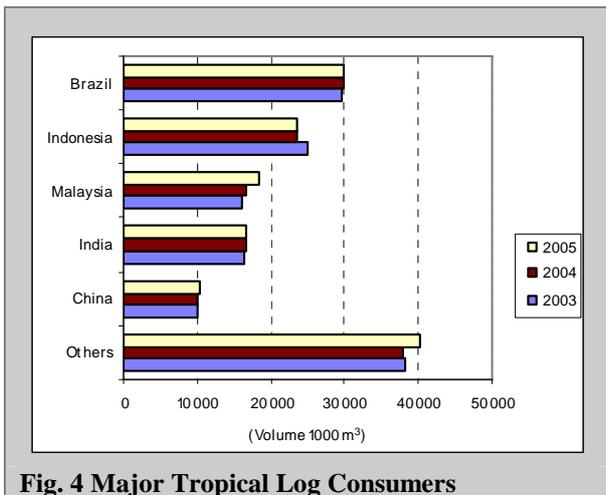

The regional breakdown of tropical log production amongst ITTO producer members is given in Appendix 1 (Table 1-1-d); the Asia-Pacific region produced about 57% of ITTO members’ tropical hardwood logs in 2004 and 2005. Latin American’s share of production remained at about 28% in both years, with the African region accounting for the remainder (about 15%).

### Consumption

Figure 4 shows that tropical log consumption for 2003-2005 was closely linked to production trends in the top four countries. Malaysian consumption increased significantly in 2004-2005, Brazil’s and India’s less so. Indonesia’s consumption decreased by almost 6% in 2004 and was stable in 2005. China overtook Thailand as the fifth largest tropical log consumer in 2004-2005, at over 10 million m<sup>3</sup>.

The top five log consuming countries accounted for over two-thirds of total ITTO consumption of tropical logs in 2004 and 2005. Apart from a drop in Asia in 2004, domestic log consumption increased in all tropical regions in 2004-2005. Africa’s sharp increase in 2005 was due to reported production increases in Gabon and

Republic of Congo. The proportion of log production utilized domestically (i.e. log production minus log exports) averaged about 89% in Asia in 2004-2005. In Latin America logs processed domestically accounted for virtually all production. African producers domestically consumed an average of 81% of their total log production in 2004-2005. While there will be short-term reversals when log exports will surge due to economic conditions, population and economic growth coupled with a focus on further processing will ultimately contribute to rising domestic log processing in producing countries.

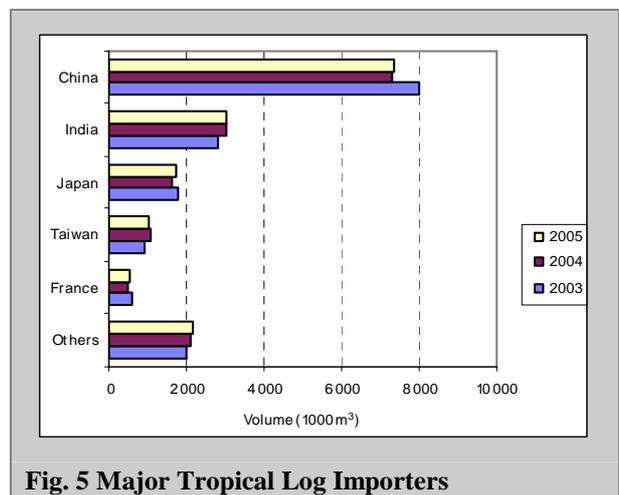

**Fig. 4 Major Tropical Log Consumers**

### Imports

Total imports of tropical hardwood logs by ITTO members decreased 3% to 15.6 million m<sup>3</sup> in 2004, about 29% (or 3.5 million m<sup>3</sup>) greater than total tropical log exports reported by all members. The gap between reported imports and exports increased to 44% (just over 4.8 million m<sup>3</sup>) in 2005. Differences between reported ITTO imports and exports is to some extent made up by reported log exports from the Solomon Islands and Equatorial Guinea, the two largest non-ITTO tropical log exporters with exports averaging around 400 000 m<sup>3</sup> each in recent years. Other non-member tropical log exporters are less significant (all under 100,000 m<sup>3</sup> per year) and include Mozambique, Laos, Singapore, Guinea, Guinea-Bissau, Benin, Viet Nam and Madagascar. The reported sum of all log exports by non-ITTO tropical countries in 2004 was 1.5 million m<sup>3</sup>, leaving up to 2 million m<sup>3</sup> plus tropical imports by non-ITTO members (estimated to be around 500 000 m<sup>3</sup>) to be accounted for by unrecorded or under-reported exports and/or over-reported imports from both members and non-members.

Figure 5 shows the top ITTO tropical log importers in 2003-2005 ranked by import volume

in 2004. China, the world's largest importer of tropical logs, imported over 7.3 million m<sup>3</sup> in 2004, an 8.9% decrease from 2003. Despite this drop in tropical imports, China's growing economy, a continuing ban on domestic harvesting and a zero tariff on log imports continue to drive total imports upwards. Tropical imports stabilized in 2005 at 7.3 million m<sup>3</sup> due to supply constraints. China's tropical log imports, which accounted for almost half of total ITTO imports in 2004-2005, have almost tripled since the mid-1990s, with Malaysia, PNG, Gabon, Myanmar and Republic of Congo the main sources. China's import of non-tropical logs continues to boom, with Russia providing the bulk of the 19 million m<sup>3</sup> imported in 2004. China's total log imports from all sources remained at 26 million m<sup>3</sup> in 2005, exceeding by far those of all other countries.

**Fig. 5 Major Tropical Log Importers**

Official Chinese statistics do not include Taiwan P.O.C. nor Hong Kong and Macao S.A.R.s, so the figures used here for these importers are based on the U.N. Comtrade database or estimates. Hong Kong S.A.R.'s tropical log imports have declined sharply since 2000, possibly due to improved accounting of re-exports to China. Taiwan P.O.C. is still a major importer, at over one million m<sup>3</sup> in 2004-2005, mainly from Malaysia (85%), Gabon, Papua New Guinea and Myanmar, although the latter reported no exports in the opposite direction.

India is now the second largest ITTO tropical log importer, with imports of just over 3.0 million m<sup>3</sup> in 2004, up 7% from 2003 levels. Imports are mostly from Malaysia and Myanmar but with an increasing component from Africa. There is a substantial discrepancy between India's reported log imports from Myanmar (528 000 m<sup>3</sup>) and Myanmar's reported exports (997 000 m<sup>3</sup>). India's imports were stable in 2005.

Japan is now the third largest ITTO tropical log importer, with imports of 1.6 million m<sup>3</sup> in 2004, down 9.1% from 2003 levels. Japanese demand for tropical logs continued to be met primarily (74%) by output from Malaysia (i.e. Sarawak) in 2004. Japan imported 319 000 m<sup>3</sup> of logs from Papua New Guinea and less than 20 000 m<sup>3</sup> from Africa (mainly C.A.R., the Republic of Congo and Gabon) in 2004. Japanese tropical log imports increased 5% in 2005. Russia continued as Japan's major log supplier, with imports from that country accounting for over 40% of non-tropical imports of 11 million m<sup>3</sup> in 2004. Larch is now a preferred species for plywood manufacture in Japan and with prices well below those of the cheapest tropical logs, it appears likely to gain further market share.

EU countries imported over 1.3 million m<sup>3</sup> of tropical logs in 2004, down 2% from 2003. European log imports rebounded to almost 1.4 million m<sup>3</sup> in 2005. Most EU tropical log imports continue to come from African producers. Imports by France (the largest EU tropical log importer) decreased by 13% to 506 000 m<sup>3</sup> in 2004 as log export restrictions in some of its main suppliers (Cameroon, Gabon, Liberia and Republic of Congo) were imposed or strengthened. French imports increased to 550 000 m<sup>3</sup> in 2005.

Italy is also a major European log importer, at 229 000 m<sup>3</sup> in 2004, mainly from Gabon, Cameroon, Republic of Congo and C.A.R. Imports by Portugal fell sharply in 2003. Portugal has in previous years reported substantial imports of eucalyptus logs from Brazil as tropical logs which were not mirrored in Brazil's export statistics. It appears Portugal has now rectified this problem but has not yet revised historical statistics. Portugal's imports, from the same sources as Italy's, dropped to 205 000 m<sup>3</sup> in 2005.

Thailand is also a major ITTO log importer, absorbing 381 000 m<sup>3</sup> in 2004 (up 16% from 2003), mainly from Malaysia (37%) and Myanmar (34%). Thailand's reported imports increased to 450 000 m<sup>3</sup> in 2005. The Philippines is the second largest ITTO producer country importer, despite a 36% decline in imports to 147 000 m<sup>3</sup> in 2004. Philippine imports were stable at 150 000 m<sup>3</sup> in 2004. Total imports of tropical logs by ITTO producing members increased by almost 10% to 3.8 million m<sup>3</sup> in 2004 and rose a further 2% in 2005.

### Exports

Figure 6 shows the major ITTO tropical log exporters in 2003-2005, ranked by 2004 export volume. Total ITTO producer member exports were almost 12 million m<sup>3</sup> in 2004. Log exports by producer members decreased by 8.7% in 2005 to 10.9 million m<sup>3</sup>. Malaysia continues to dominate the trade in tropical logs with 5.1 million m<sup>3</sup> exported in 2004, constituting 42.8% of ITTO producer member exports. Malaysia's log trade in 2004 decreased in volume by 6.4% from 2003 levels, and a further 12.1% to 4.5 million m<sup>3</sup> in 2005. Appendix 2 (Table 2-1) shows that Malaysia's major log customers are all in Asia, with China, Taiwan P.O.C., India and Japan accounting for 83% of the reported log export volume in 2003. Malaysia's large log trade discrepancy with China in 2004 (140% or almost 1.6 million m<sup>3</sup>) is in sharp contrast to its relatively close agreement with other importers' reports, the second year this has been observed. This may be related to the apparent decrease in Indonesia-China log trade (see below), with the possibility of substantial mislabelling or misreporting of the source(s) of China's imported tropical logs requiring further investigation.

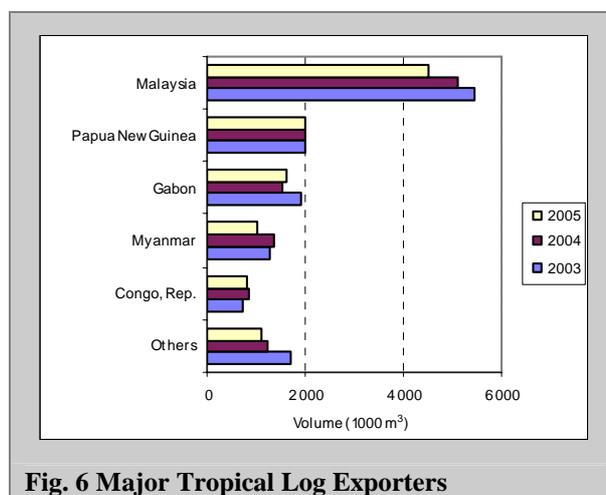

Fig. 6 Major Tropical Log Exporters

Papua New Guinea overtook Gabon as the second largest tropical log exporter in 2004, at over 2 million m<sup>3</sup>, level with 2003 exports. However, PNG's log exports still remain far below the pre-Asian crisis level of almost 3 million m<sup>3</sup> per year. Appendix 2 shows that while a significant quantity of PNG's log exports (17% in 2004) still go to Japan, the Chinese market has grown rapidly to account for about 64% of PNG's exports in 2004, mainly in lower grades.

Gabon's exports decreased by 21.3% in 2004 to 1.5 million m<sup>3</sup> as a decline in European markets outweighed an increase in trade with China.

Gabon's exports increased to 1.6 million m<sup>3</sup> in 2005. Gabon's main log trading partners have traditionally been European countries such as France, Italy and Portugal, but China is now its largest trading partner.

Due to its ongoing log export ban and tighter controls to regulate illegal trade, Indonesia's tropical log exports stabilized at an estimated 100 000 m<sup>3</sup> in 2004. Indonesia signed agreements in 2003-2004 to stem illegal log flows with some major trading partners (e.g. China, Japan and the UK), while Malaysia introduced legislation banning the import of logs and squared timber from Indonesia. Despite these measures, trade figures still continue to show major discrepancies. China's reported imports (92 000 m<sup>3</sup>) were far greater than the level reported by Indonesian customs authorities (88 m<sup>3</sup>), supporting the claims of many observers that substantial undocumented or illegal Indonesian log exports continue to exist. The possible mislabelling of Indonesian logs as Malaysian (see above) means that actual Indonesian exports could be much higher than reported.

Log exports by Myanmar (the fourth largest tropical log exporter at almost 1.4 million m<sup>3</sup>) increased by 7% in 2004. Myanmar's main trading partners are India, Thailand and China (although there are major discrepancies between the figures provided by Myanmar and both India and China - see Appendix 2).

Africa supplies the majority of the remainder of world tropical hardwood log exports. Gabon is the region's largest exporter (and, as noted above, ITTO's third largest), but Republic of Congo, Cameroon, Central African Republic and Côte d'Ivoire also exported substantial quantities of logs in 2004. The Republic of Congo's exports have nearly doubled since 2000 as it compensates for restricted supplies from other African countries. Cameroon's exports more than tripled from the depressed levels of 2003, reaching 228 000 m<sup>3</sup> in 2004 before dropping to 153 000 m<sup>3</sup> in 2005. Cameroon is promoting increased local processing and has imposed limitations on log exports which appear to be having variable impacts. Liberia, ITTO's fifth largest tropical log exporter in 2003, saw log exports drop to zero in 2004-2005. After resolving a long-running civil war (which led to drastic decreases in official log production and exports for most of the 1990's) in 1998, log exports grew rapidly to offset declines from other African countries. However, due to renewed

conflict, the U.N. Security Council imposed a ban on imports of logs from the country in mid-2003. The U.N. embargo was intended to halt the use of timber export revenues to fund illegal arms transactions. The embargo forced main importers such as China and France to look to other sources. It was initially imposed for ten months, but was renewed for another year in 2004 despite continued pleas from the Liberian transitional government to relax it. The U.N. imposed ban was expected to be reviewed in 2006 following the election of a new government in Liberia.

Exports of tropical logs by consumer countries decreased by 10.6% to 126 000 m<sup>3</sup> in 2004. Consumer countries did not in general provide detailed breakdowns of exports or re-exports of tropical timber products (value or destination), but a significant portion of this trade is known to be between EU countries. Consumer country exports of tropical logs declined another 10% in 2005, dropping to 113 000 m<sup>3</sup>.

### **Prices**

Appendix 4-1 shows indicative real (1990) and nominal FOB price trends for export logs of two West African and five Southeast Asian species as well as domestic price trends for Malaysian rubberwood logs (this species is used mainly in the domestic market for the manufacture of furniture and furniture parts for export).

Prices for some of the more important internationally traded species of West African logs showed mixed trends in 2005, due at least partially to exchange rate fluctuations (prices declined in US dollar terms but were rising or stable in euros). The improvement of log prices in euros reflected greater demand (including from China and India); disruptions in log supply due to political unrest in the West African region; UN sanctions banning Liberian log exports; and the increasing prevalence of log export bans in the region.

After reaching record lows of \$132/m<sup>3</sup> (\$171/m<sup>3</sup> nominal) in late 2001, Cameroon's khaya prices rose gradually for most of 2002-2004 to reach \$197/m<sup>3</sup> (\$269/m<sup>3</sup> nominal) in late 2004. Recovery in prices was due to a shortage of logs as a result of new and tougher regulations on forest concessions. Khaya prices also benefited from increased demand for substitutes for South American mahogany (*Swietenia* spp.) for which supply has declined since its inclusion in Appendix II of CITES in 2003. Khaya prices reached a 7-year high of \$197/m<sup>3</sup> (\$275/m<sup>3</sup>

nominal) but lost momentum after that. Overall in 2005, khaya prices rose 8% in euro terms but fell 5% in US dollar terms to \$186/m<sup>3</sup> (\$261/m<sup>3</sup> nominal) due to a 12% depreciation of the euro. Further increases in euro prices were prevented by a sluggish European market and substitution by Asian species. Prices for this species are expected to remain firm in euro terms despite a dull European market.

Prices for sapelli (or sapele), another reddish brown timber from the Congo Basin found in countries from Liberia to Gabon, reversed their upward trend in 2005, affected by the strengthening of the US dollar and weak EU demand. Sapelli prices, which reached record lows of \$155/m<sup>3</sup> (\$201/m<sup>3</sup> nominal) in late 2001, had been rising steadily since 2002 to reach an almost 11-year high (in nominal terms) of \$250/m<sup>3</sup> (\$343/m<sup>3</sup> nominal) in late 2004. Prices in US dollars for sapelli weakened steadily through 2005 and were around \$216/m<sup>3</sup> (\$303/m<sup>3</sup> nominal) at the end of the year. Prices for sapelli logs were also under pressure due to the relatively low prices for Asian meranti, an alternative red/brown timber which is quoted in US dollars.

Figure 7 shows differences in trends of sapelli log nominal FOB export prices in US dollars and euros for the UK market. In 2003-2004 there were apparent price gains in dollar terms largely due to the strengthening of the euro during that period (most African species are invoiced in euros). While sapelli log prices quoted in euros rose by only 10% between 2003-2004, the weakening of the US dollar meant that the price of this species in dollars had risen by four times that amount. Conversely, the apparent price losses in dollar terms in 2005 were largely due to the strengthening of the US dollar. While sapelli log prices quoted in US dollars fell by 11% in 2005, the weakening of the euro meant that the price of this species in euro was relatively stable, with weak demand in Europe preventing price increases.

The graphs in Appendix 4-1 shows that after the sharp drop during the Asian crisis of 1997 and 1998, prices of some species of Asian logs have been gradually recovering. However, most have traded at real prices between \$100 and \$140/m<sup>3</sup> from late 1998 through 2004, still well below pre-crisis levels.

In Malaysia, selangan batu and kapur log prices rose gradually in the first half of 2005 to \$123/m<sup>3</sup> (\$173/m<sup>3</sup> nominal) and \$113/m<sup>3</sup> (\$158/m<sup>3</sup>

nominal), respectively. Real prices remained around those levels in the third quarter of 2005 before surging sharply to \$147/m<sup>3</sup> (\$205/m<sup>3</sup> nominal) and \$132/m<sup>3</sup> (\$185/m<sup>3</sup> nominal) late that year, 8-year highs for these species.

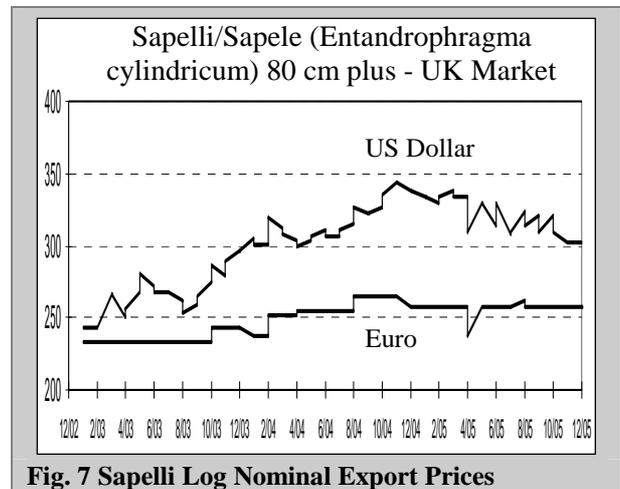

Fig. 7 Sapelli Log Nominal Export Prices

Real prices for keruing and meranti logs continued to firm in 2005. Real prices for these species rose steadily through 2005 and, after a sharp hike, closed the year trading at \$147/m<sup>3</sup> (\$205/m<sup>3</sup> nominal) and \$167/m<sup>3</sup> (\$235/m<sup>3</sup> nominal), also 8-year highs. In nominal terms, meranti log prices reached almost a 12-year high, exceeding pre-crisis levels. Apart from shortages in supply of Asian logs and the restriction on log exports from Indonesia, firming prices for these products were due also to growing demand in China and India. Both of these relatively new large-scale importers were importing a wide variety of sizes and grades, while Japan (the traditional market for Asian logs but now declining) preferred larger sizes and much tighter grading at lower prices.

Long-term log supplies in both Sabah and Sarawak have been declining in response to tighter enforcement of harvesting rules and resource constraints. Both states continue to divert a rising proportion of their log and veneer supplies to domestic plywood manufacturing plants. This continues to cause concern in Japan and China whose own domestic mills are heavily dependent on Malaysian raw material supplies.

Domestic price trends for Malaysian rubberwood logs since early 1996 are also shown in Appendix 4-1. Virtually all of Malaysia's rubberwood resources are directed to local wood manufacturing and the fast growing furniture export sector. After reaching a low of \$18/m<sup>3</sup> (\$23/m<sup>3</sup> nominal) in early 1998, rubberwood log prices rose gradually during 1999-2001 and

rebounded sharply and steadily through 2002-2005. Domestic rubberwood log prices were trading at \$82/m<sup>3</sup> (\$115/m<sup>3</sup> nominal) in late 2005, a new record high for this species.

This surge in prices has been driven by prices of natural rubber, which have been soaring along with prices of oil-based synthetic rubber. This has persuaded rubber planters to continue tapping existing trees and to delay planting new ones for timber, resulting in reduced timber supply. Another factor driving up rubberwood log prices was the increased demand from the MDF and particle board industry that competes fiercely with sawmills for rubberwood logs. Prices surged despite the re-imposition of the export ban/quota on rubberwood logs and sawnwood in 2004. The area of rubber plantations in Malaysia continued to decline as plantation companies switched to oil palm from which returns are higher than for latex and timber. Rubberwood log supply continued to fall while the demand from furniture, MDF and particle board manufacturers kept growing.

Appendix 4-1 also shows price trends of three grades of Myanmar teak logs from mid-1997 when data for this product began to be regularly collected by the MIS. Teak 4th grade logs are generally used for sliced veneer production while SG-2 to SG-4 grades are for sawing. Prices for teak logs, which were practically unaffected during the 1997 Asian financial turmoil, have generally risen since then. In the case of 4th and SG-2 teak grades, real prices reached record highs of \$2 041/m<sup>3</sup> (\$2 740/m<sup>3</sup> nominal) and \$1 191/m<sup>3</sup> (\$1 598/m<sup>3</sup> nominal) in early 2003 or later. However, prices of these two teak grades declined sharply to \$1 611/m<sup>3</sup> (\$2 162/m<sup>3</sup> nominal) and \$771/m<sup>3</sup> (\$1 035/m<sup>3</sup> nominal) during the second half of the year and fluctuated widely around that level through most of 2004. The decline was due to a US ban on all trade with Myanmar; a change of the currency used in the monthly teak auctions from the US dollar to the euro; and administrative changes in the team responsible for regulating teak exports. In 2005, 4th and SG-2 grade teak log prices rose in euro terms but declined in US dollars and by year-end were trading at \$1 579/m<sup>3</sup> (\$2 209 nominal) and \$777/m<sup>3</sup> (\$1 087/m<sup>3</sup> nominal) as the US dollar strengthened. Price increases in euros were due to reduced availability of high log grades and price corrections on the back of a weaker euro.

Prices for SG-4 grade teak have been comparatively less volatile than those of the other two grades. SG-4 teak prices reached record highs

of around \$608/m<sup>3</sup> (\$802/m<sup>3</sup> nominal) in mid-2002, before declining slightly but steadily during the second half of the year and for most of 2003 and 2004, with a brief price surge in mid-2004. SG-4 teak logs surged briefly in early 2005 to a new record high of \$609/m<sup>3</sup> (\$852/m<sup>3</sup> nominal) before giving up most of this gain in the second half of the year to trade at \$412/m<sup>3</sup> (\$577/m<sup>3</sup> nominal) in late 2005. In euro terms, however, prices for SG-4 grade teak logs in late 2005 were 15% up from December 2004.

Much of Myanmar's teak is now processed domestically into higher value-added products. The government has a stated policy to expand domestic manufacturing which is leaving fewer logs for export.

## Sawnwood

### *Production*

Production of tropical sawnwood in ITTO producing countries totalled 40.7 million m<sup>3</sup> in 2004, up 4.1% from 2003. Tropical sawnwood production in these countries grew a further 1.6% to 41.3 million m<sup>3</sup> in 2005 due to increases in all producing regions. Africa, which makes up only 10% of ITTO production, still suffers from weak infrastructure and environmentally demanding export markets that constrain major investments in wood processing, but production is gradually rising due to log export bans and requirements for further processing in many countries. Latin America, with around 44% of ITTO tropical sawnwood production, grew by over 2% to 18.2 million m<sup>3</sup> between 2003 and 2005. Asian production grew by 10% over the same period, to above 18.9 million m<sup>3</sup> in 2005. The Asian region accounted for around 46% of tropical sawnwood production in producer countries in 2004 and 2005.

Figure 8 shows the major ITTO producers of tropical sawnwood in the 2003-2005 period, ranked by 2004 production. Brazil is by far the largest ITTO tropical sawnwood producer, at an estimated 15.9 million m<sup>3</sup> in 2004. India (6 million m<sup>3</sup>), Malaysia (4.9 million m<sup>3</sup>), Indonesia (3.4 million m<sup>3</sup>) and Thailand (2.8 million m<sup>3</sup>) were other major producers of tropical sawnwood in 2004. Production in all of these countries except Malaysia was relatively stable in 2005. Malaysia's tropical sawnwood production increased 2.5% to 5.1 million m<sup>3</sup> in 2005. The top five tropical sawnwood producing countries comprised over 80% of ITTO sawnwood production in 2004-2005.

Appendix 1 shows that six other countries (Nigeria, Myanmar, Cameroon, China, Peru and Côte d'Ivoire) produced over 500 000 m<sup>3</sup> of tropical sawnwood in 2004. Production increased in 2005 in all of these countries, except for Nigeria (stable), Cameroon and Côte d'Ivoire (both declined).

Consumer countries produced over 1.8 million m<sup>3</sup> of tropical sawnwood in 2004, up by almost 32% from 2003 levels, with the increase due to a surge in China's production. Chinese tropical sawnwood production, which more than tripled to 564 000 m<sup>3</sup> in 2003 from 170 000 m<sup>3</sup> in 2002 jumped again to 1 050 000 m<sup>3</sup> in 2004. China's tropical sawnwood production continued climbing in 2005 when it reached 1 260 000 m<sup>3</sup>. Japan's production continued its steady decline, dropping 12% to 177 000 m<sup>3</sup> in 2004 where it remained in 2005.

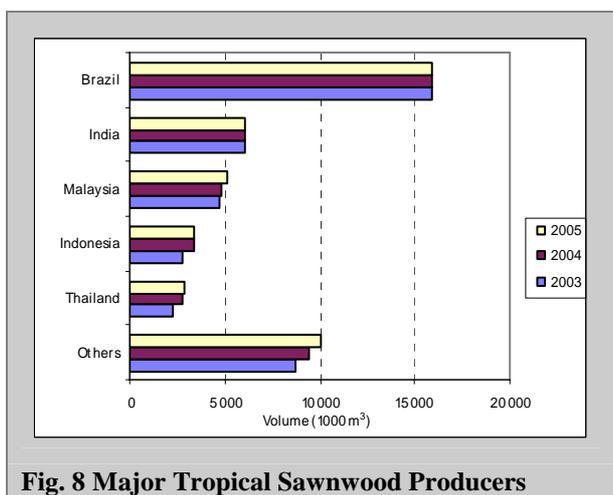

Fig. 8 Major Tropical Sawnwood Producers

### Consumption

Figure 9 shows the main ITTO consumers of tropical sawnwood, ranked by 2004 consumption. Consumption of tropical sawnwood by ITTO consumer countries rose by 13% between 2003 and 2005, from 8.2 million m<sup>3</sup> to 9.2 million m<sup>3</sup>, due to increased imports overall and increased production by China. In contrast, consumption by producer countries was flat at around 33.7 million m<sup>3</sup> over the same period. The five countries in Figure 9 accounted for over 70% of ITTO members' consumption of tropical sawnwood in 2004.

Brazil was by far the largest ITTO tropical sawnwood consumer at over 14 million m<sup>3</sup> (down by 2.5% from 2003) in 2004 and 2005. India was second, consuming around 6 million m<sup>3</sup> in 2004. China and Malaysia follow in third and fourth place, with tropical sawnwood consumption of over 4 million m<sup>3</sup> and 3.1 million m<sup>3</sup> respectively.

Both increased consumption in 2005, China more sharply than Malaysia. Nigeria was the largest (and only major) tropical sawnwood consumer in Africa. Consumption by Nigeria remained stable at nearly 2 million m<sup>3</sup> in 2004 and 2005.

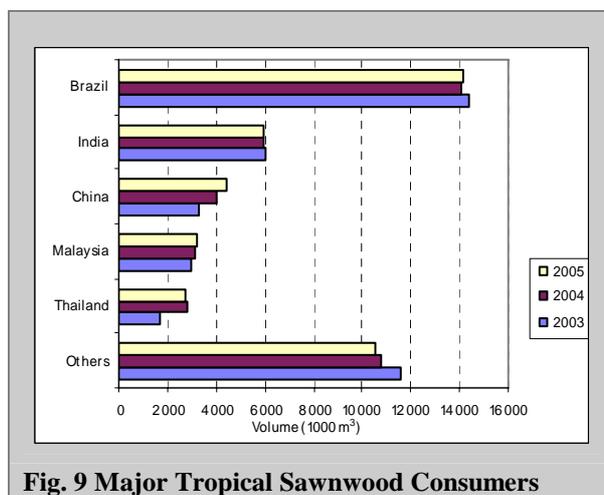

Fig. 9 Major Tropical Sawnwood Consumers

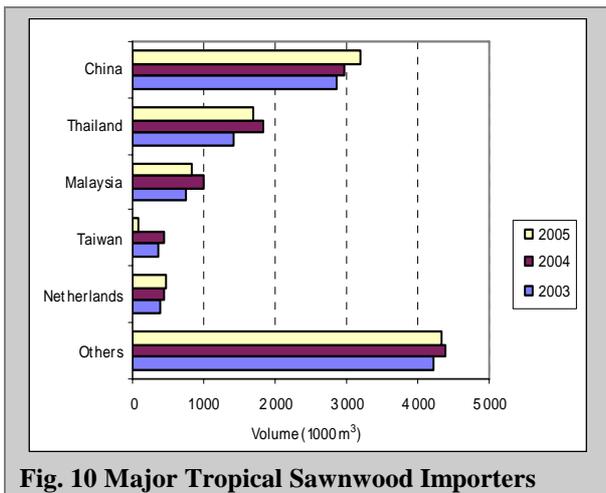

Figure 9 shows that China continues to maintain its place as one of ITTO's top five tropical sawnwood consumers. China's consumption of tropical sawnwood has grown rapidly in the last five years, overtaking Japan, Thailand and Malaysia among other countries. Japan's tropical sawnwood consumption continued declining in 2004 (by 20%) but rebounded by 9% in 2005, to 605 000 m<sup>3</sup>. Japan's tropical sawnwood consumption had been falling for several years to 2004 due to the country's slow economy and substitution by softwoods.

### Imports

Total ITTO imports of tropical sawnwood increased 11% to over 11.1 million m<sup>3</sup> in 2004 but declined to 10.6 million m<sup>3</sup> in 2005. Figure 10 shows the major ITTO sawnwood importers in 2003-2005, ranked by 2004 import volume. With 2004 imports of almost 3.0 million m<sup>3</sup>, China is by far the top ITTO tropical sawnwood importer. China's imports increased by 4.3% in 2004, and a further 7% in 2005 to offset reduced log imports from Indonesia. China's tropical sawnwood imports are mainly from Indonesia (32%), Thailand (28%) and Malaysia (14%). China's, Hong Kong S.A.R.'s and Taiwan P.O.C.'s combined imports accounted for over 50% of ITTO consumer imports in 2004. Taiwan P.O.C.'s reported imports were sharply down in 2005.

Thailand imported over 1.8 million m<sup>3</sup> of tropical sawnwood (up 30%) in 2004 as its large furniture and secondary processing industries continued to boom. However, Thai imports fell in 2005 to 1.7 million m<sup>3</sup>. Thailand's tropical sawnwood imports

come primarily from Malaysia (65% of the total), which is also a major sawnwood importer.

Total tropical sawnwood imports by EU countries increased by almost 10% in 2004 to just under 2.6 million m<sup>3</sup> due primarily to increased imports in the Netherlands, France, and Italy. Brazil, Malaysia and Indonesia are the main sources for EU imports, accounting for over half of the total. Côte d'Ivoire, Cameroon and Ghana supplied virtually all of the remainder of EU imports. European tropical sawnwood imports increased nearly 3% in 2005 to over 2.6 million m<sup>3</sup>. The Netherlands is the largest importer of tropical sawnwood in the EU, absorbing 450 000 m<sup>3</sup> in 2004 (up 15% from 2003) and 475 000 m<sup>3</sup> in 2005. The Netherlands' imports are primarily from Malaysia, Brazil and Cameroon. France, Spain, Italy, Belgium and the UK were other major EU tropical sawnwood importers in 2004.

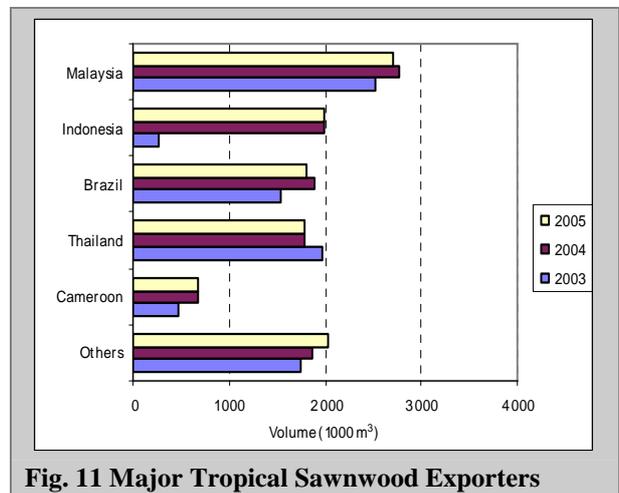

Japan was ITTO's fifth largest tropical sawnwood importer in 2003, but imports dropped by almost a quarter to 378 000 m<sup>3</sup> in 2004. Japanese imports of tropical sawnwood have fallen by over 75% since the mid-1990s, offset by increased imports of softwood lumber (primarily from Canada and increasingly Scandinavia).

As the size of the bar for "Others" in Figure 10 indicates, the tropical sawnwood market is the most diversified of all primary tropical timber products, with the five largest importers accounting for only 60% of total ITTO imports in 2004.

### Exports

Figure 11 shows the major ITTO tropical sawnwood exporters in 2003-2005, ranked by 2004 export volume. ITTO producers exported a total of almost 10.5 million m<sup>3</sup> of tropical sawnwood in 2004, up nearly 31% from 2003.

This large increase was due to an adjustment in Indonesian figures (see below). ITTO members account for most of global exports of tropical sawnwood, with Singapore and Paraguay the only significant non-member exporters in 2004. Malaysia continues to lead the trade in tropical sawnwood, with the 2.8 million m<sup>3</sup> exported in 2004 constituting 27% of total ITTO producer member exports. Malaysia's sawnwood trade rose by 10% in 2004 as its major markets of China, Taiwan P.O.C., Thailand and the Netherlands increased their consumption. Appendix 2 (Table 2-2) shows that Malaysia's other major sawnwood customers in 2004 were Hong Kong S.A.R. and Japan. There were, however, large discrepancies between the trade flows reported by Malaysia and trading partners China, Hong Kong S.A.R. and Thailand in 2004.

Estimates for Indonesia's exports of tropical sawnwood were adjusted sharply upwards to 1 993 000 m<sup>3</sup> in 2004. Appendix 2 shows that Indonesia's official export figures severely underestimate total trade as importers (especially China) report arrivals of almost ten times more sawnwood than Indonesia reports exporting. Discussions are underway with Indonesian authorities to attempt to revise trade statistics for 2002-2003 to reflect actual trade flows and to attempt to stem what appears to be a large undocumented flow of sawnwood out of the country.

Brazil is now the third largest ITTO tropical sawnwood exporter, overtaken by Indonesia due to the adjustment to its official export figures in 2004. Brazil exported just under 1.9 million m<sup>3</sup> in 2004, up 22% from 2003 levels. Brazil's major sawnwood markets are China, France, the Netherlands and Spain. Brazil's exports decreased to 1.8 million m<sup>3</sup> in 2005. Thai exports declined 9% to 1 791 000 m<sup>3</sup> in 2004 and remained stable

in 2005. Cameroon increased exports significantly (to 682 000 m<sup>3</sup>, up 42%) in 2004, mainly to Italy and Spain. Cameroon's exports were also stable in 2005.

ITTO consumer countries exported 481 000 m<sup>3</sup> of tropical sawnwood in 2004, primarily (84%) from EU countries. In the EU, exports of tropical sawnwood have increased from 376 000 m<sup>3</sup> in 2001 to 403 000 m<sup>3</sup> in 2004. Belgium, a larger tropical sawnwood exporter than most producer countries, was the main EU tropical sawnwood exporter at 180 000 m<sup>3</sup> in 2004, followed by the Netherlands and Germany. Total consumer country exports of tropical sawnwood dropped to 456 000 m<sup>3</sup> in 2005, due to a decline of nearly 9% (to 368 000 m<sup>3</sup>) in EU exports.

### Prices

Real (1990) and nominal sawnwood FOB price trends for three Ghanaian species, two Malaysian species and three Latin American species of tropical sawnwood are included in Appendix 4-2.

The strength of demand for African mahogany (khaya or acajou, one of the continent's most valuable sawnwood export species) firmed in 2005, with the species achieving a 4% price gain in euros and a 2% decline in US dollars during the year. African mahogany sawnwood reached a new record high (in nominal terms) of \$457/m<sup>3</sup> (\$626/m<sup>3</sup> nominal) in early 2005. Prices for African mahogany sawnwood declined gradually to \$436/m<sup>3</sup> (\$611/m<sup>3</sup> nominal) in late 2005 as the US dollar strengthened. The USA continued absorbing most of the African mahogany made available in the market as the supply of South American mahogany (*Swietenia macrophylla*), strongly favoured by US consumers, continued to be restricted. The volume of trade increased supported by the strength of the dollar against the euro.

Wawa (or obeche) sawnwood prices reached record highs of \$331/m<sup>3</sup> (\$445/m<sup>3</sup> nominal) by mid-2003 when UK importers increased buying to replenish stocks. Wawa prices ended that year on a downward trend due to a greater supply of sawn wawa from Ghana and a quiet UK market, a reflection of long-term shifts in the furniture manufacturing sector towards the outsourcing of furniture components. Wawa prices firmed in 2004 and closed the year at \$294/m<sup>3</sup> (\$403/m<sup>3</sup> nominal). In early 2005, wawa prices rebounded to \$301/m<sup>3</sup> (\$421/m<sup>3</sup> nominal) before declining gradually (both in euros and dollars) to \$265/m<sup>3</sup> (\$371/m<sup>3</sup> nominal) late that year. The overall

market for wawa in Western Europe has been shrinking as manufacturers either relocate or import mouldings and other semi-finished components from Africa or low-cost locations in Eastern Europe and Asia. Wawa demand has also been affected by MDF substitution in some European markets.

After reaching new lows of \$321/m<sup>3</sup> (\$423/m<sup>3</sup> nominal) in early 2002, real prices for iroko (or odum, currently West Africa's most valuable sawnwood export species) rebounded and rose steadily, recording new highs of \$601/m<sup>3</sup> (\$824/m<sup>3</sup> nominal) in late 2004. FOB prices for iroko sawn timber firmed due to disruption of iroko trade in Côte d'Ivoire (affected by a serious political crisis) and robust demand in the UK, Germany and Mediterranean countries. Iroko real prices fluctuated under the \$600/m<sup>3</sup> level in the first half of 2005 before declining in the second half of the year to \$522/m<sup>3</sup> (\$730/m<sup>3</sup> nominal). Iroko prices weakened due to high stocks in Europe and increased supply from D.R. of Congo and Gabon. However, demand from China remains strong and prices are expected to firm in the near future.

Figure 12 shows differences in trends of iroko sawnwood nominal export prices in US dollars and British pounds. Iroko sawnwood prices quoted in pounds were slightly rising or relatively stable for most of 2005, while prices for this species in US dollars dropped by over 11% due to the strengthening of that currency.

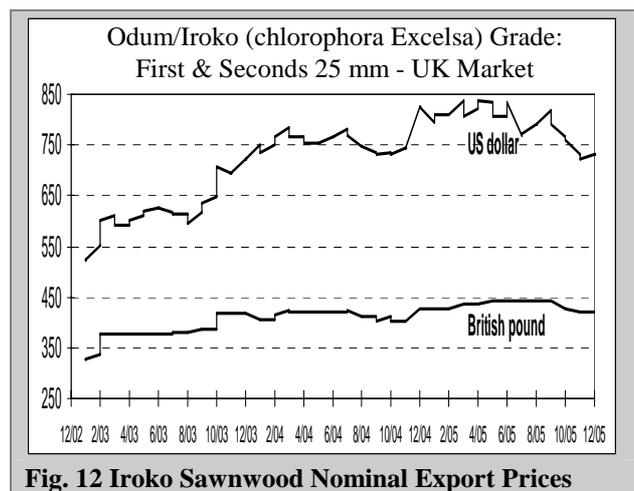

Fig. 12 Iroko Sawnwood Nominal Export Prices

Prices for Malaysian dark red meranti sawnwood, which rebounded in 2002 due to the tight supply of the species in sawmills in Peninsular Malaysia and the Indonesian ban on log exports, continued an upward trend throughout most of 2003-2005 as Indonesia extended its ban to sawnwood exports in 2004. Prices for dark red meranti sawnwood in

the UK market reached a six-year high of \$524/m<sup>3</sup> (\$733/m<sup>3</sup> nominal) in early 2005, before declining gradually to \$492/m<sup>3</sup> (\$689/m<sup>3</sup> nominal) by year-end as the US dollar strengthened against the pound. Prices in British pounds continued to firm for the remainder of the year, due to restrictions on log and sawnwood imports from Indonesia and increased diversion of logs to plywood mills that deprived Malaysian sawmills of an important source of raw material. Prices for Malaysian sawnwood were expected to remain firm due to continuing restrictions on availability of raw materials.

After declining for most of the 1995-2001 period and firming in 2002, seraya (also known as light red meranti, a medium density utility timber) scantlings prices were stable in a narrow range of \$376-384/m<sup>3</sup> (\$505-515/m<sup>3</sup> nominal) in 2003. Real prices moved up sharply to \$489/m<sup>3</sup> (\$670/m<sup>3</sup> nominal), a six-year high, in early 2004 due largely to increased demand for this species in Japan (despite its declining overall demand for tropical sawnwood) and, to a lesser extent, in Europe. Seraya scantlings prices declined slightly in late 2004 and early 2005, firmed at \$465/m<sup>3</sup> (\$650/m<sup>3</sup> nominal) in late 2005 and went up to \$477/m<sup>3</sup> (\$668/m<sup>3</sup> nominal) by year-end.

After reaching record prices in late 2002, trade in Latin American mahogany (*Swietenia macrophylla*, the region's most valuable species) slowed significantly following a total ban on logging, transportation, processing and trade of all mahogany products imposed by Brazil's IBAMA and the subsequent inclusion of this species in Appendix II of CITES in 2003. Since mid-2003, internationally traded mahogany sawnwood has been largely from Peru. Prices for Peruvian mahogany to the US market, which were at \$879/m<sup>3</sup> (\$1 180/m<sup>3</sup> nominal) in 2003, increased in 2004 following the species' inclusion in CITES Appendix II. Prices continued upwards in 2005 after the establishment of a mahogany export quota in Peru early in the year and were at \$1 143/m<sup>3</sup> (\$1 600/m<sup>3</sup> nominal) by year-end, an all time high.

After peaking at a record high of \$524/m<sup>3</sup> (\$680/m<sup>3</sup> nominal) in early 2001, real prices for jatoba sawnwood declined steadily for most of 2001-2004, reaching \$387/m<sup>3</sup> (\$530/m<sup>3</sup> nominal) in late 2004 due mainly to a sharp slide in the Brazilian real. Prices for this Brazilian species rebounded in 2005 to reach \$450/m<sup>3</sup> (\$630/m<sup>3</sup> nominal) in the third quarter, due mainly to a strong recovery of the real. However, this trend

was reversed in the last quarter of the year as exporters were losing competitiveness with other products in the international market. Jatoba prices were trading at \$429/m<sup>3</sup> (\$600/m<sup>3</sup> nominal) in late 2005. Brazilian producers have been developing new markets for tropical sawnwood species like jatoba in East Asia and elsewhere in order to reduce their dependence on the US market.

A graph showing Brazilian pine sawnwood price trends is included in Appendix 4-2 to allow comparison of prices of a relevant coniferous species with those of tropical hardwoods. After reaching new lows of \$89/m<sup>3</sup> (\$120/m<sup>3</sup> nominal) in early 2003, Brazilian pine sawnwood prices increased gradually for most of 2004 due to strong US demand. Prices retreated slightly in early 2005 before rising again to \$96/m<sup>3</sup> (\$135/m<sup>3</sup> nominal) in the second quarter of the year and remained at this level. Unlike jatoba sawnwood prices, sawn pine prices were less affected by the devaluation of the real as prices were supported by strong demand in export markets for value-added pine products such as clear blocks, blanks and mouldings.

## Veneer

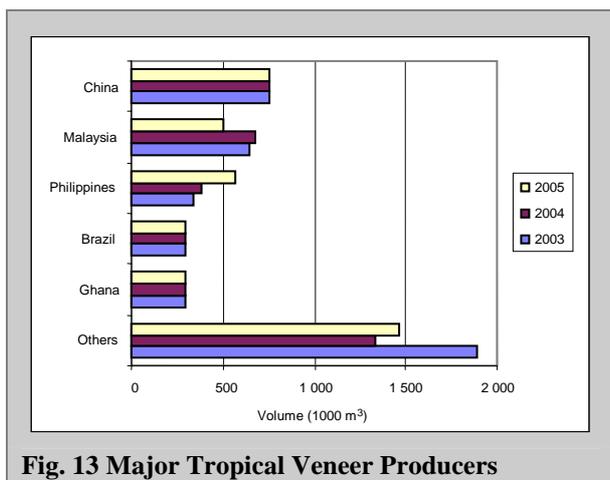

### Production

Production of tropical veneer in ITTO producing countries totalled nearly 2.9 million m<sup>3</sup> in 2004. Veneer production figures should not include veneer used in domestic plywood production and therefore represent only the production of veneer intended to be traded as such. Veneer production in producing countries decreased by 14.4% in 2004 before increasing by 4.8% to over 3 million m<sup>3</sup> in 2005. The Asian region produced nearly 1.7 million m<sup>3</sup> of tropical veneer in 2004, Africa produced 780 000 m<sup>3</sup> and Latin America produced 369 000 m<sup>3</sup>. Veneer production rose in Asia, Latin America, and Africa (up 1.2%, 0.3%, and 15% respectively) in 2005. The main ITTO veneer producers in 2003-2005 are shown in Figure 13. ITTO producers account for virtually all veneer production and trade from the tropics.

China remains ITTO's largest tropical veneer producer after overtaking Ghana, Brazil, the Philippines and Malaysia, among other countries, over the last four years. Its production reached 750 000 m<sup>3</sup> in 2003 (more than double 2001 levels) and was stable in 2004-2005. Chinese production accounts for almost 20% of total ITTO veneer production.

Malaysia, for many years the largest tropical veneer producer, produced 643 000 m<sup>3</sup> in 2003.

Malaysian production rose to 679 000 m<sup>3</sup> in 2004 before dropping by 26.3% to 500 000 m<sup>3</sup> in 2005. After almost doubling tropical veneer production since 2002, production in the Philippines reached 385 000 m<sup>3</sup> in 2004 to make it ITTO's third largest tropical veneer producer, overtaking Brazil. The Philippines' production jumped a further 48.8% to 573 000 m<sup>3</sup> in 2005. The Philippines, like several other countries, does not appear to have sufficient logs available to produce the amounts of sawnwood, veneer and plywood claimed, indicating errors in statistics and/or unofficial (e.g. illegal) log sources.

**Fig. 13 Major Tropical Veneer Producers**

Brazil was ITTO's fourth largest tropical veneer producer with 300 000 m<sup>3</sup> in 2004. Its production made up 81.3% of ITTO's Latin American total in 2004 and 8% of total ITTO veneer production.

Ghana is the only African country in the top five tropical veneer producers. Ghana increased veneer production by 13.6% (to 300 000 m<sup>3</sup>) in 2003 and remained at that level in 2004-2005. The top five tropical veneer producing countries comprised nearly two-thirds of ITTO veneer production in 2004.

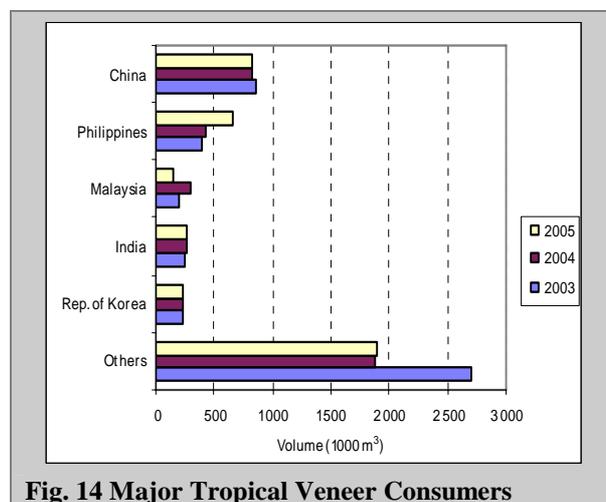

India (258 000 m<sup>3</sup>), Côte d'Ivoire (274 000 m<sup>3</sup>), Thailand (165 000 m<sup>3</sup>) and Gabon (120 000 m<sup>3</sup>) were the only other significant ITTO veneer producers in 2004. Côte d'Ivoire and India had stable production in 2005 while the production of Gabon more than doubled (to 250 000 m<sup>3</sup>) and the production of Thailand increased by 6% (to 175 000 m<sup>3</sup>).

ITTO consuming countries produced 887 000 m<sup>3</sup> of tropical veneer in 2004, up by 1.1% from 2003 levels. Consumer production was stable in 2005. Production of tropical veneer in consumer countries in 2004 was split between China, including Hong Kong and Macao S.A.R.s, (85%),

the EU (8%), Taiwan P.O.C. (4.5%), and Japan (2.2%). China, Taiwan P.O.C. and Japan consume most of the tropical veneer they produce, although China is beginning to export limited quantities. The EU, however, exports more than it produces, re-exporting some of its imports from tropical countries, mainly to other European countries. EU production increased 26.7% to 71 000 m<sup>3</sup> in 2004 and remained at this level in 2005. Japan's production of tropical veneer has remained stable at 20 000 m<sup>3</sup> in 2004 and 2005. Japan's tropical veneer production has dropped by two-thirds since 2001 as its tropical veneer and plywood industries have contracted due to declining log availability, increased softwood substitution and its sluggish economy during most of that period.

### Consumption

Consumption of veneer not destined for plywood in the furniture and other secondary processing industries of ITTO member countries fell by over 15% in 2004 to 3.9 million m<sup>3</sup>. Consumption rebounded by 2.7% to over 4 million m<sup>3</sup> in 2005. Consumption in ITTO consumer countries declined by 3.3% in 2005 to 1.7 million m<sup>3</sup>. Figure 14 shows the major ITTO consumers of tropical veneer from 2003-2005.

**Fig. 14 Major Tropical Veneer Consumers**

China maintained its position as ITTO's largest tropical veneer consumer in 2004, far ahead of the Philippines, Malaysia, India and the Republic of Korea, among other countries. Chinese tropical veneer consumption decreased by 2.4% to 830 000 m<sup>3</sup> in 2004 and remained stable in 2005. The Philippines' tropical veneer consumption rose by 6.5% to 423 000 m<sup>3</sup>, which consolidated it as ITTO's second largest tropical veneer consumer in 2004, accounting for 10.7% of total ITTO veneer consumption. Malaysia became ITTO's third largest tropical veneer consumer after jumping by 51% to 293 000 m<sup>3</sup> in 2004,

overtaking India and the Republic of Korea. The Philippines increased its tropical veneer consumption in 2005 by 54.1%, while Malaysia's fell by 47%. The EU (mostly Italy and France) is also a major tropical veneer consumer, with 353 000 m<sup>3</sup> in 2004 and 342 000 m<sup>3</sup> in 2005. Taiwan P.O.C. and Thailand were the only other significant tropical veneer consumers. Taiwan P.O.C.'s consumption decreased by 26% between 2004 and 2005 (from 211 000 m<sup>3</sup> to 156 000 m<sup>3</sup>) while Thailand's consumption increased by 5.1% in 2005 (from 198 000 m<sup>3</sup> to 208 000 m<sup>3</sup>). The top five tropical veneer consuming countries comprised nearly 52% of total ITTO veneer consumption in 2004.

### Imports

Many importing countries do not differentiate between the various types of veneer and plywood (e.g. softwood/hardwood, temperate/tropical) in trade statistics. For plywood, different species of veneers (softwoods and hardwoods) are increasingly used in production. The lack of resolution in trade statistics is compounded by the fact that countries use a wide variety of scales to measure trade in panel products. Some countries use volume (as is reported here), some use surface area and still others use weight. All of these can be reported in metric or imperial units, depending on the country. Many countries report only aggregate trade, combining tropical and non-tropical veneers and panels. Some also aggregate veneer and plywood into a single category. The discrepancies in trade partner reports in Appendix 2 for veneer can also be partially due to the use of different conversion factors in different countries. The adoption of a standard measurement system for veneer and panel products is a priority if improvements in the accuracy of these statistics are to be achieved.

Figure 15 shows the major ITTO veneer importers for 2003-2005, ranked in order of 2004 import volume. Total ITTO tropical veneer imports decreased 11% to 1.3 million m<sup>3</sup> in 2004, followed by an increase of 16% in 2005. With a 3.5% increase in 2004, Korea remained the largest ITTO tropical veneer importer at 236 000 m<sup>3</sup>. Korean tropical veneer imports were stable in 2005. Taiwan P.O.C. is the second largest tropical veneer importer, at around 177 000 m<sup>3</sup> in 2004 and 122 000 m<sup>3</sup> in 2005. Mexico, ITTO's third largest tropical veneer importer in 2004 at 175 000 m<sup>3</sup>, passed Taiwan P.O.C. in 2005 when its imports doubled to 361 000 m<sup>3</sup>. Meanwhile, China's imports (previously ITTO's largest) dropped by 23% to

98 000 m<sup>3</sup> in 2004 and remained the same in 2005 as it met its veneer needs increasingly via production from imported tropical logs.

The EU increased imports of tropical veneer in 2004 to 357 000 m<sup>3</sup> (up by 17.4%) then decreased in 2005 to 345 000 m<sup>3</sup> (down by 3.3%). Nevertheless, the share of the EU still accounted for over one-fifth of total ITTO imports in 2005. The majority of European imports are from African producers (mainly Cameroon, Côte d'Ivoire, Gabon and Ghana). Japan imported 44 000 m<sup>3</sup> of tropical veneer in 2004, a 10% increase from 2003 levels, but decreased imports by 4.5% in 2005 to 42 000 m<sup>3</sup>. Formerly a major tropical veneer importer, Japan is now a less significant importer than producer countries like Malaysia and the Philippines.

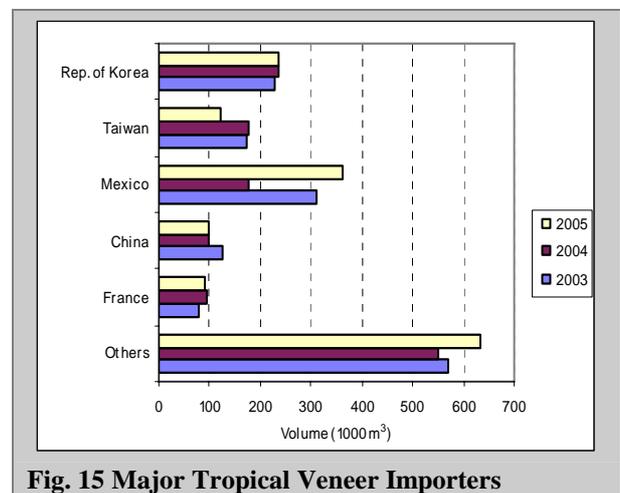

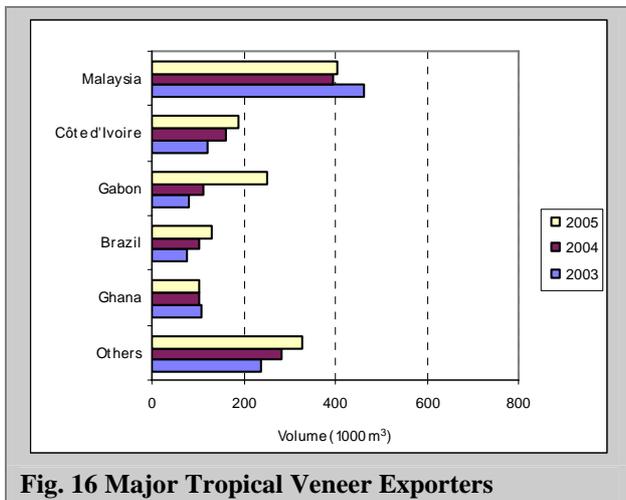

Fig. 15 Major Tropical Veneer Importers

### Exports

Figure 16 shows the top ITTO tropical veneer exporters in 2003-2005, ranked in order of 2004 export volume. Total ITTO producer member exports increased by 8% to just over 1 million m<sup>3</sup> in 2004. ITTO producer country veneer exports increased by 24% in 2005. Malaysia continues to be the ITTO's dominant veneer exporter, with exports of 396 000 m<sup>3</sup> in 2004 accounting for 38.4% of the ITTO producer member total. Appendix 2 (Table 2-3) shows that Malaysian exports are mainly directed to China, Japan, Taiwan P.O.C., the Philippines, and the Republic of Korea.

Côte d'Ivoire became the second largest tropical veneer exporter in 2004 following a 35% increase. Côte d'Ivoire's exports increased by another 15% in 2005. Gabonese tropical veneer exports increased by 38% between 2003 and 2004 before more than doubling in 2005 (from 120 000 m<sup>3</sup> to 250 000 m<sup>3</sup>). Brazil overtook Ghana as the fourth largest ITTO tropical veneer

exporter in 2004. Brazil's trade rose by 33% (to 105 000 m<sup>3</sup>) and 24% (to 130 000 m<sup>3</sup>) in 2004 and 2005 respectively. Ghana's exports have been relatively stable between 2003 and 2005 at around 105 000 m<sup>3</sup>.

**Fig. 16 Major Tropical Veneer Exporters**

The EU accounted for 75 000 m<sup>3</sup> of total consumer country tropical veneer exports of 130 000 m<sup>3</sup> in 2004, remaining stable in 2005. Italy, Spain and Germany are the largest EU tropical veneer exporters. Total exports by ITTO consumer countries were stable in 2005.

### Prices

The international market for tropical veneers remains relatively small (around 5% of ITTO producers' total export value of primary tropical timber products in 2004) and is mainly for decorative sliced veneer. The market for sliced veneer is rather specialized and there are no clear benchmark species whose prices reflect overall market trends. Tropical veneer prices are therefore not regularly covered by the ITTO MIS and are also not regularly quoted by any other readily available source. Appendix 1 (Tables 1-2-b and 1-2-d) shows the average unit value of tropical veneer imports and exports, while Appendix 3 provides details of the species and (in some cases) grades of veneer traded by countries together with average prices. Appendices 1 and 3 show that consuming country exports of tropical veneer were usually of much higher value than those from producer countries, with the differences more pronounced than for other tropical products.

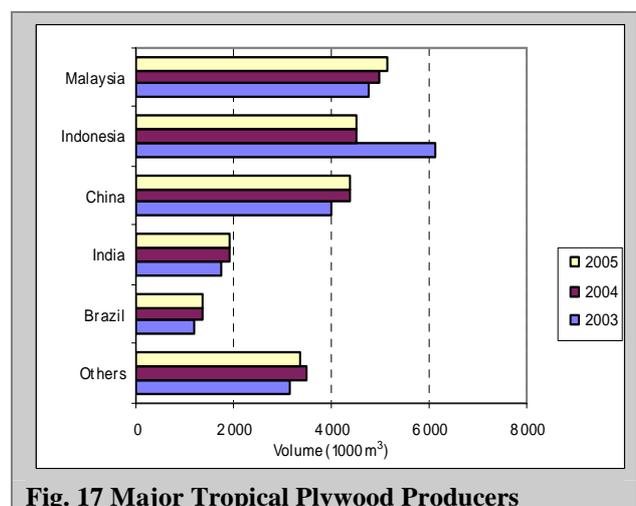

## Plywood

### Production

Production of tropical plywood in ITTO producing countries totalled 14.4 million m<sup>3</sup> in 2004, down 5.2% from 2003. Plywood production

in producing countries increased by 1.3% in 2005. The main ITTO plywood producers in 2003-2005 are shown in Figure 17.

Following steady reductions in production from 2001 to 2003 (when it was 6.1 million m<sup>3</sup>), Indonesia plywood production fell sharply to 4.5 million m<sup>3</sup> in 2004, allowing Malaysia to take over as the top ITTO producer. Indonesian plywood production was stable in 2005. Plywood production has declined significantly (by 38%) in the last five years in Indonesia due to reductions in logging quotas and crackdowns on illegal log flows. 2004-2005 production was at the lowest level since the early 1980s when Indonesia's plywood capacity began being rapidly increased. In contrast to Indonesia, Malaysia's plywood production jumped by 4.3% to almost 5 million m<sup>3</sup> in 2004 and a further 3.1% to 5.1 million m<sup>3</sup> in 2005. The Asian region produced 12.1 million m<sup>3</sup> of plywood in 2004 (about 84% of total producer member production), Latin America produced just under 2 million m<sup>3</sup> (14%) and Africa produced 335 000 m<sup>3</sup> (2%). Like veneer, ITTO members account for virtually all global production and trade of tropical plywood.

**Fig. 17 Major Tropical Plywood Producers**

Production in China (the third largest tropical plywood manufacturer), remained stable at 4.4 million m<sup>3</sup> in 2004 and 2005, closing in on Indonesian production levels. China has doubled its tropical plywood production in the last five years to keep pace with the demand of its growing construction sector and to feed a growing export sector. China is set to overtake Indonesia as the world's second largest producer of tropical plywood in the near future.

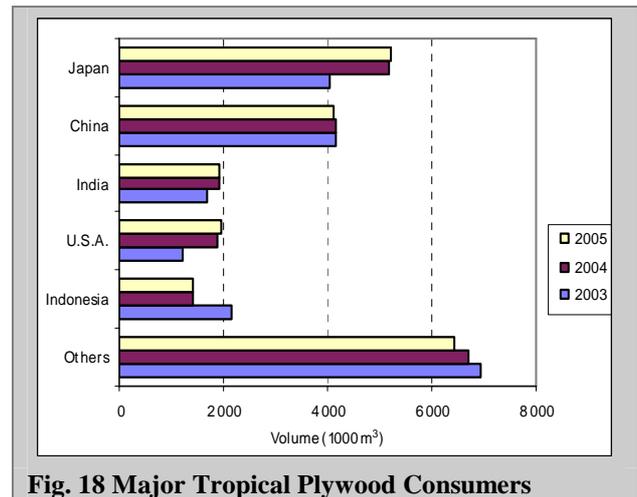

India's tropical plywood production, like China's based largely on imported tropical logs, is also rising rapidly. India's production soared 10% in

2003 to almost 1.8 million m<sup>3</sup> overtaking Brazil and Japan. It surged a further 10% to over 1.9 million m<sup>3</sup> in 2004 and remained at this level in 2005. Brazil also sharply increased its production of tropical plywood in 2004 (up by 15%), remaining stable in 2005. The top five tropical plywood producing countries comprised 83% of ITTO plywood production in 2004-2005. Japan, Taiwan P.O.C., the Philippines and France were also significant producers of tropical plywood in 2004-05, accounting for most of the remaining 17%.

ITTO consuming countries produced almost 6.3 million m<sup>3</sup> of tropical plywood in 2004 (about 30% of total ITTO production), an 8.2% increase from 2003. ITTO consuming countries' production then fell to just over 6.1 million m<sup>3</sup> in 2005. Tropical plywood production in Japan continued the downward trend of recent years. It decreased by 16.6% to 625 000 m<sup>3</sup> in 2004 and remained at that level in 2005. Japan's production has almost halved in the last five years and represents under 14% of its tropical plywood imports. This is a big change from the situation that existed in the half century from 1945-95, when domestic production consistently exceeded imports. As discussed elsewhere and in previous Reviews, Japanese plywood manufacturers are increasing the proportion of softwoods used in plywood production, as well as introducing lamination and other techniques to allow re-use of concrete form-ply. Substitution by reconstituted panels is also occurring. Furthermore, several plywood manufacturers from Japan (as well as from Taiwan P.O.C. and elsewhere) have established joint ventures for plywood and other panel products in producer countries where costs are more competitive.

### Consumption

Figure 18 shows the top ITTO consumers of tropical plywood for 2003-2005. Aggregate consumption in consumer countries increased to 15.3 million m<sup>3</sup> in 2004 due mainly to increases in Japan (up 28%) and the USA (up 52%). Japan's consumption rose in 2004 as it was increasingly able to source imports compliant with a new formaldehyde emission standard introduced in 2003. China's consumption of tropical plywood remained stable in 2003-2005 at just over 4.1 million m<sup>3</sup>. While Chinese consumption is predicted to remain strong, tropical plywood consumption in most traditional markets will at best remain stable and is more likely to fall in future as substitutes and more efficient uses are increasingly adopted.

**Fig. 18 Major Tropical Plywood Consumers**

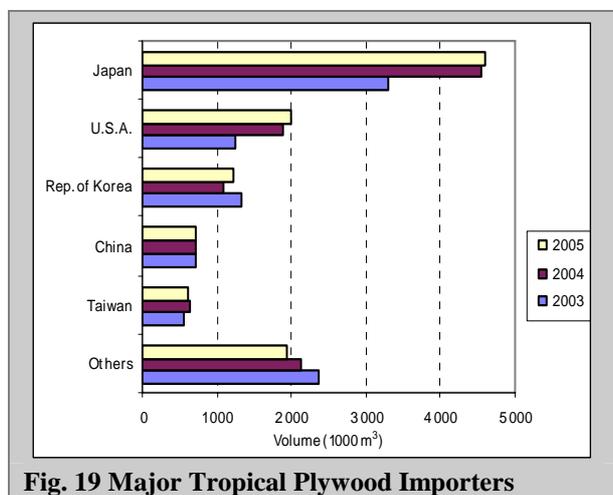

Aggregate consumption of plywood in producing countries decreased by 7.4% from 6.4 million m<sup>3</sup> in 2003 to 5.9 million m<sup>3</sup> in 2004, due largely to decreased consumption in Indonesia and Malaysia. Aggregate consumption fell by a further 4.2% in 2005 to 5.7 million m<sup>3</sup> due to consumption decreases in Malaysia as exports increased faster than production. India has rapidly increased its consumption of tropical plywood in recent years, growing by 9.9% to just around 1.7 million m<sup>3</sup> in 2003 and by 12.1% to 1.9 million m<sup>3</sup> in 2004 (where it remained in 2005). The top five tropical plywood consuming countries accounted for over two-thirds of total ITTO consumption in 2004.

### Imports

Figure 19 shows the major ITTO plywood importers for 2003-2005, ranked by import volume in 2004. Total ITTO imports of tropical plywood jumped by 15.6% to almost 11 million m<sup>3</sup> in 2004, before increasing further to 11.1 million m<sup>3</sup> in 2005.

The majority of all tropical plywood imports are sourced from Indonesia and Malaysia (53% and 44% respectively in 2005 for the top importer, Japan). As noted in the plywood production section, Japan continues to replace domestic hardwood plywood production with softwoods, imported plywood (tropical and non-tropical) and substitutes like OSB and MDF. Nonetheless, its tropical plywood imports increased by another 1% to 4.6 million m<sup>3</sup> in 2005 after a strong increase of almost 38% in 2004. The 2003 drop was largely due to an inability to source sufficient supplies of plywood from Indonesia that were compliant with a new standard restricting formaldehyde emissions from building materials, introduced by the Japanese government that year. Imports rebounded in 2004 after sufficient mills

in Indonesia were certified to produce according to the new standard. Apart from the sharp drop in 2003, the recent trend toward increasing plywood imports by Japan is partially due to its difficulty in obtaining tropical logs for domestic production in the face of competition from China. Low prices (compared to the cost of domestic production) also continue to make imported plywood more attractive than domestic production. As shown in Appendix 2, Japan (according to China's export statistics) is also now importing significant quantities of low-priced tropical plywood from China. Finally, Japan has converted much of its tropical plywood processing capacity to handle smaller imported Russian larch logs, resulting in higher imports to partially offset the resulting drop in domestic tropical production.

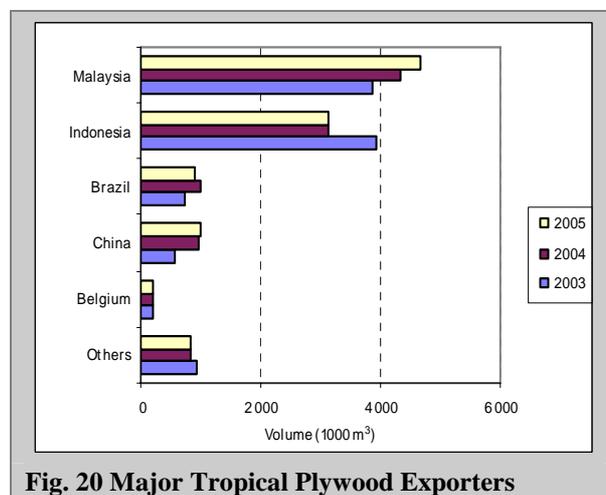

**Fig. 19 Major Tropical Plywood Importers**

The USA overtook Korea as ITTO's second largest tropical plywood importer in 2004 at over 1.8 million m<sup>3</sup>, a strong increase from 2003 (51.4%). 21.1% of the US plywood imports were from Indonesia, 25.7% from Malaysia and most of the rest from China and Brazil. US imports increased by 5.4% in 2005. Korea was ITTO's third largest tropical plywood importer in 2004, at over 1.1 million m<sup>3</sup>. After many years as Korea's main plywood supplier, Indonesia has now been replaced by Malaysia. Malaysia accounted for almost 46% of the Korean market in 2004, compared to Indonesia's 30.8%. China's imports dropped 1.4% in 2004 to 706 000 m<sup>3</sup> and remained stable in 2005. Chinese imports remain at only around one-quarter of mid-1990s levels as authorities continue policies to increase domestic plywood production from imported logs to boost employment and offset reduced domestic log supplies. Tariffs on imported plywood are 15%, compared to zero for logs. Taiwan P.O.C. (628 000 m<sup>3</sup>) was also a substantial tropical plywood importer in 2004, from Malaysia (48.1%), Indonesia (42.3%), and China (7.7%).

EU imports of tropical plywood totalled nearly 1.2 million m<sup>3</sup> in 2004, a 15.7% decrease from 2003 levels. EU imports are mostly accounted for by the UK, Belgium, the Netherlands, Germany, Italy and France. Most of the EU's tropical plywood also came from Indonesia and Malaysia, with Brazil and inter-European trade also playing a fairly large role in many countries' imports. China continued to export growing amounts of tropical plywood to the EU, particularly to the UK where quality and pricing concerns regarding this product have been raised. European imports of tropical plywood increased slightly in 2005.

### Exports

Figure 20 shows the major ITTO tropical plywood exporters in 2003-2005. In 2004, ITTO producer exports declined by 1.8% to just under 9 million m<sup>3</sup>. Tropical plywood exports by producers recovered in 2005 to 9.2 million m<sup>3</sup> due mainly to increases in Malaysian exports. Malaysia overtook Indonesia in 2004 as the largest tropical plywood exporter with its 4.3 million m<sup>3</sup> exported in 2004 constituting nearly 41.4% of total ITTO producer member exports. Malaysia's exports increased by another 7% in 2005. Its exports are mainly to Japan, Korea and the USA.

**Fig. 20 Major Tropical Plywood Exporters**

Indonesia was traditionally Malaysia's major competitor in the tropical plywood trade, but its exports are moving in the opposite direction. Indonesia's plywood exports slumped by 21% to 3.1 million m<sup>3</sup> in 2004 and remained at that level in 2005. Indonesian exports are down from highs of around 10 million m<sup>3</sup> (or 85% of total ITTO producer exports) in the early 1990s.

Latin American tropical plywood exports increased by 29.3% in 2004 to 1.1 million m<sup>3</sup>, led by Brazil. Brazil's tropical plywood exports increased by 35.7% to 1 million m<sup>3</sup> in 2004 but

declined to 900 000 m<sup>3</sup> in 2005. The USA and the EU (mainly the UK, Germany and Belgium) are the major markets for Brazil's hardwood plywood. Africa's plywood exports decreased by 17.8% in 2004 (from 218 000 m<sup>3</sup> to 179 000 m<sup>3</sup>) but rebounded by 6.1% in 2005 (to 190 000 m<sup>3</sup>). Ghana is Africa's main tropical plywood exporter, accounting for over 40% of the region's total in 2004.

ITTO consumer country exports of tropical plywood increased by 35% to 1.5 million m<sup>3</sup> in 2004 due mainly to a sharp increase in exports by China to 959 000 m<sup>3</sup>. China's boom in tropical plywood exports to markets like the EU, Taiwan P.O.C. and Japan is notable since it is largely based on logs sourced from ITTO producer country exporters, many of which have been steadily losing share in these plywood markets. China's surging tropical plywood exports reached 1 million m<sup>3</sup> in 2005, when it overtook Brazil as the third largest exporter. Chinese exports initially comprised mainly okoume plywood (now subject to heavily tariffs in the EU) and later included other "combi" plywood products with a domestic poplar core and tropical bintangor or meranti face. Chinese plywood products are comparatively lighter and cheaper than Southeast Asian products while their quality has improved noticeably in recent years. Interest in alternative Chinese plywood products is tending to rise in many markets as the long-term trend is towards declining availability from Indonesia.

Tropical plywood exports from the EU grew by 2% to 488 000 m<sup>3</sup> in 2004, when it accounted for slightly more than 32% of consumer exports. EU exports were mainly from Belgium and France in 2004. Total consumer country exports of tropical plywood were stable at just over 1.5 million m<sup>3</sup> in 2005.

### **Prices**

Appendix 4-3 includes graphs showing recent trends in real FOB prices for various grades and thicknesses of Indonesian, Malaysian and Brazilian plywood. The main tropical species used in the manufacture of plywood for export in 2003-2004 are given in Appendix 3. Three graphs showing C&F import prices for Indonesian plywood products in Japan from 1992 to the end of 2005 are also included for reference.

Plywood export prices from all suppliers surged in 2004-2005 due to growing log supply problems (in Indonesia and Malaysia), strong demand in the USA and the UK and bottlenecks in shipments.

For Southeast Asian plywood, the focus of this analysis is on Indonesian prices, which are usually closely correlated with Malaysian prices. After reaching record lows in early 2002, prices of Indonesian BB/CC moisture resistant (MR) plywood hovered around \$179/m<sup>3</sup> (\$240/m<sup>3</sup> nominal), \$153/m<sup>3</sup> (\$205/m<sup>3</sup> nominal) and \$117/m<sup>3</sup> (\$158/m<sup>3</sup> nominal) for 2.7 mm, 3 mm and 6-18 mm thicknesses, respectively for most of 2002 and early 2003. Prices were depressed due to a weak housing market in Japan. Prices rebounded from mid-2003 when supply tightened after Japanese authorities introduced new standards (Japan Agricultural Standards, JAS) for low formaldehyde emissions on plywood for structural use. Prices for 2.7 mm, 3 mm and 6-18 mm panels continued to rise steadily in 2004-2005 due to shortages in raw material supply. Prices for these plywood thicknesses reached eight-year highs (in nominal terms) of \$297/m<sup>3</sup> (\$415/m<sup>3</sup> nominal), \$275/m<sup>3</sup> (\$385/m<sup>3</sup> nominal) and \$232/m<sup>3</sup> (\$325/m<sup>3</sup> nominal) respectively by year-end, but were still about \$100/m<sup>3</sup> or more below of the highs of 1996. Price gains reflected declining log availability as a result of reduced logging quotas in Indonesia; increased control on illegal logging; strengthening of the housing market in Japan; and bottlenecks in shipping capacities. Further price rises were prevented by fierce competition from cheaper Chinese combi-plywood and mounting concern over illegal logging that led some large importers to switch away from Indonesian plywood altogether. Chinese plywood products will continue gaining ground in Europe and other major markets as the long-term trend is towards declining availability from Indonesia. The market is awaiting the impact of the EU's "voluntary partnerships" (known as Forest Law Enforcement, Governance and Trade (FLEGT) partnerships) with timber exporting countries. Indonesia was expected to be amongst the first countries to sign such a partnership agreement.

Brazilian tropical plywood prices have also recovered in recent years thanks to strong demand, particularly in the USA and the UK. Prices of white virola plywood (5.2 mm), the most popular Brazilian product, which reached record lows in early 2003 of \$164/m<sup>3</sup> (\$220/m<sup>3</sup> nominal), have been rising gradually throughout 2004-2005. Some of the price gains in the last quarter of 2005 were due to the strong demand generated by the impact of Hurricane Katrina on the US Gulf Coast. This product was trading at \$279/m<sup>3</sup> (\$390/m<sup>3</sup> nominal) in late 2005. Brazilian exporters continued adjusting

production to the new requirements of a compulsory “CE marking” standard for the manufacture of structural plywood introduced in the EU in early 2004 (norm EN 13986). The growing but still insufficient supply of “CE marked” product has also contributed to increased white virola plywood prices.

Prices for Brazilian elliotis pine plywood (15 mm), included here for comparison purposes, were less severely affected during the 1997-98 market turbulence than Brazil's tropical plywood exports but were stuck around \$123/m<sup>3</sup> (\$162/m<sup>3</sup> nominal) between 2000 and mid-2003. Low prices were blamed on weak demand in Europe. By mid-2003 the strength of housing demand in the USA started to have an impact on demand. Brazilian exporters began to switch their focus from Europe to the USA and prices began to move up. In the first quarter of 2004, Brazilian elliotis pine plywood prices reached \$215/m<sup>3</sup> (\$295/m<sup>3</sup> nominal), a record high since this product has been tracked by the ITTO MIS. Brazilian suppliers of softwood plywood increased their deliveries to the USA to become its major supplier, well ahead of the former main source country, Canada. However, prices for elliotis pine plywood declined sharply at the end of 2004 to \$135/m<sup>3</sup> (\$185/m<sup>3</sup> nominal) due to overstocking in the USA. In 2005, demand picked up again and prices firmed. However, in mid-2005, Brazilian softwood plywood lost its duty free status in the USA under the GSP system due to high import levels. In addition, the EU imposed a 7% duty on the product after the duty free annual quota was exceeded. Brazil is also facing stiff competition from Chinese plywood exporters, which, with a more favourable

exchange rate and low production costs, have managed to make inroads in Europe and the USA at more competitive prices. Prices for pine plywood surged in late 2005 as preparations for the post-Katrina housing reconstruction efforts started. Brazilian elliotis pine plywood was trading at \$175/m<sup>3</sup> (\$245/m<sup>3</sup> nominal) by year-end.

The graphs for C&F prices of Japanese plywood imports from Indonesia in Appendix 4-3 show that after halving during the Asian economic crisis and mostly declining until early 2002 (due to the slow Japanese construction sector), real prices for concrete form board panels, floor base and thin panels recovered gradually until mid-2004. Prices for the three plywood products reached five-year highs of \$288/m<sup>3</sup> (\$395/m<sup>3</sup> nominal), \$367/m<sup>3</sup> (\$503/m<sup>3</sup> nominal) and \$444/m<sup>3</sup> (\$608/m<sup>3</sup> nominal) respectively, as the effects of tighter Indonesian log supplies on plywood exports were felt. Price increases were also due to the strong demand for, and growing supply of, Indonesian plywood compliant with the new JAS regulations on formaldehyde emissions referred to above. Prices of Japanese plywood imports lost momentum in the second half of 2004 due to substitution by cheaper Chinese and softwood plywood products. Japanese importers were exerting downwards pressure, causing price reductions for some products. Prices for concrete form and floor base panels continued to decline in 2005 while those for thin panels firmed as competition from Chinese plywood was stronger in thicker panels. By late 2005, prices for the three plywood products were at \$250/m<sup>3</sup> (\$350/m<sup>3</sup> nominal) for concrete form, \$304/m<sup>3</sup> (\$425/m<sup>3</sup> nominal) for floor base and \$397/m<sup>3</sup> (\$555/m<sup>3</sup> nominal) for thin plywood.

## 4. TRADE AND PRICES OF SECONDARY PROCESSED WOOD PRODUCTS

The importance of secondary processed wood products (SPWP) to ITTO members is reflected in their inclusion in both the ITTA's objective of promoting further processing of tropical timbers and Goal 1 of the ITTO Yokohama Action Plan providing for the Organization to undertake "regular assessments ... on secondary products". The SPWP trade data presented here was extracted from the UN Commodity Trade Statistics (COMTRADE) database, which contains time series of trade statistics to 2004 for developed and some developing countries. This chapter is based on these trade value data for the 2000-2004 period, which are summarized as Tables 5-1 to 5-8 in Appendix 5, as well as any information on further processing provided by members in their responses to the 2005 Joint Forest Sector Questionnaire.

### Data Limitations

All trade data for China in Appendix 5 includes aggregate figures from mainland China, Hong Kong S.A.R. and Macao S.A.R., with a breakdown provided in Table 7 (page 34). The EU comprises trade data for the 15 country members as of early 2004 (EU-15). In order to maintain consistency in data reported for different years in Appendix 5, only EU-15 are included in EU figures despite accession of 10 new countries in May 2004. Where appropriate, EU-25 totals are also provided in the text. Producer totals may be under-estimates due to non-reporting or partial reporting to COMTRADE by some countries, especially for 2004. Table 5 shows the ITTO member countries that had provided no or partial trade data to COMTRADE as of late 2005 for the 2000-2004 period. Several ITTO African countries do not provide any trade data to COMTRADE whatsoever, and only four out of ten African member countries provided data for 2004. Similarly, Myanmar and Vanuatu in

Asia-Pacific had not reported any data to COMTRADE for any of the five years between 2000 and 2004 by the end of 2005. Table 5 also shows that overall 14 out of 33 ITTO producer country members had not provided data for 2004 to COMTRADE by the end of 2005. "Mirror" statistics from partner countries and/or JQ responses (where available) were used to supplement missing information and to generate aggregate totals in Tables 5-1 to 5-8 of Appendix 5.

This approach, while helping to fill in gap for individual countries, also contributes to the narrowing of gaps between the aggregate statistics of importers and exporters. For example, the value of ITTO consumer imports from producer countries in Table 5-1 exceeded the value of producer exports to consumer countries in Table 5-7 by 16% in 2003, a difference that can be accounted for by insurance and freight charges. This difference dropped to only 5% in 2004, which is too small considering the usual cost, insurance and freight (CIF) basis of import reports and is at least partially a result of the use of mirror statistics. Figures in Tables 5-1 to 5-8 in Appendix 5 have been ranked by 2004 trade figures, the reference year in this analysis, although (as noted above) 2004 figures were still preliminary or missing in many cases at the time of downloading the data from COMTRADE in late 2005.

### SPWP Trade

Table 6 shows the SPWP categories considered in the analysis and their corresponding trade nomenclature in the Standard International Trade Classification, Revision 3 (SITC, Rev.3) and in the 1996 and 2002 versions of the Harmonized Commodity Description and Coding System of the Customs Cooperation Council (Harmonized

Table 5. ITTO Members with COMTRADE Data Gaps 2000-2004					
2000	2001	2002	2003	2004

	Vanuatu	Thailand		Myanmar	
		Vanuatu		Nepal	

<b>Table 6. SPWP Categories and International Trade Nomenclature Classification</b>			
SPWP Category	Description	Classification	
		SITC Rev.3	HS 96/HS 02
Wooden furniture and parts	Seats, n.e.s, with wooden frames	821.16	9401.61, 9401.69
	Furniture, n.e.s., of wood	821.5	9403.30-60
Builders' woodwork	Builders' joinery and carpentry	635.3	4418
Other SPWP	Packaging, cable drums, pallets, etc.	635.1	4415
	Coopers' products and parts	635.2	4416
	Wood products for domestic/ decorative use, excluding furniture	635.4	4414, 4419, 4420
	Other manufactured wood products	635.9	4417, 4421
Mouldings	Continuously shaped or profiled wood (e.g. mouldings, unassembled strips and friezes for parquet flooring, beaded wood, dowels, etc.)	248.3 248.5	4409
	Cane and bamboo furniture and parts	Seats of cane, bamboo, etc. Furniture of other material like bamboo	821.13 821.79

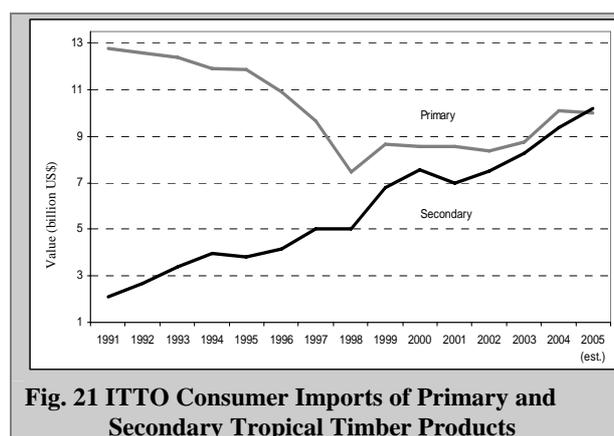

System or HS 96/02). The primary categories of tropical SPWP in trade are wooden furniture (the major category, accounting on average for almost two-thirds of trade values); builder's woodwork (joinery and other builder's wood); other SPWP (packing, wooden boxes, etc.; casks, barrels, vats and other cooper's products; picture frames; table/kitchenware and other articles for domestic/decorative use; and tools, handles, brooms and other manufactured products); and mouldings (continuously shaped or profiled wood such as parquet flooring). Since furniture and parts of cane and bamboo have become important non-wood tropical forest products exports for many ITTO member countries, these products are also included in this analysis. It should be noted that other SPWP analyses sometimes include product categories not included here (e.g. "other" furniture parts) which may or may not include wood. This analysis includes only those products explicitly specified as including wood.

### **Major Importers**

Table 5-1 (Appendix 5) shows the top ten importers of SPWP from all sources together with the proportion accounted for by ITTO producers and consumers for 2000 to 2004. Imports of SPWP by ITTO consumers represented 92% of the world's imports of these products in 2004. All ten of the world's major SPWP importers were ITTO consumer members and together accounted for 83% of total consumer imports. ITTO producers accounted for 16% (\$9.4 billion) of total SPWP imports by consumers in 2004, down from 17% in 2003 and 19% in 2000.

Despite this drop in market share in consumer markets, Figure 21 shows that the value of SPWP imports from ITTO producers kept recording new highs in 2003-2004. The value of SPWP imports from ITTO producers was over 95% of the total value of the primary tropical timber product imports by ITTO consumers in 2003, up from 89% in 2002. The share of SPWP in total tropical imports declined to 93% in 2004 as primary imports recovered. Figure 21 shows that ITTO consumers' imports of SPWP were expected to exceed the imports of tropical primary products (by 2%) for the first time in 2005.

ITTO consumer imports of SPWP from ITTO producer countries grew by about 24% between 2000 and 2004, slower than the 44% growth in imports of these products from all sources. ITTO consumer imports of SPWP from other ITTO consumer countries have grown more rapidly (by 45%) over the same period but consumers' market

share of total consumer imports has remained stable for the past several years at around two-thirds of the total consumer SPWP market worth \$58.7 billion in 2004.

The proportion of SPWP imports from ITTO producers accounted for by the top ten ITTO importers reached 94% in 2004, up from an average 89% over the previous four years. The United States was by far the world's largest importer of SPWP with \$21.7 billion worth of SPWP imports in 2004 (34% of world SPWP imports), up 18% from \$18.4 billion in 2003. The US was also the largest importer from ITTO producer countries with imports worth almost \$4.8 billion. These countries accounted for 22% of its huge import market for SPWP in 2004, up from 21% in 2003 but down from 25% in 2000. US imports of SPWP have increased almost four-fold in the last decade and by 52% in the last five years. The US market has been the engine driving international SPWP (mainly furniture) trade during this period.

Continued growth in US SPWP imports has been propelled by a strong housing market and related demand for interior wood products. USA imports come predominantly from other ITTO consumers (70% in 2004), whose share of the US market seems to have stabilized around that level in the last three years. Imports came mainly from China, Canada and the EU (notably Italy) in 2004. China, which overtook Canada as the largest SPWP supplier to the USA in 2002, competes fiercely for the large US market. USA imports from ITTO consumer countries grew by 57% in value from 2000 to 2004, while imports from producer countries grew more slowly, rising by 34%. US imports of tropical SPWP came mainly from Brazil, Mexico, Indonesia, Malaysia, Thailand and Vietnam in 2004.

The EU region's aggregate imports of SPWP still exceed those of the USA. The fifteen member states imported \$26.3 billion of these products in 2004 (up 11% from 2003), led by Germany, the UK, France, Belgium and the Netherlands, which together accounted for 79% of the EU total. EU imports of SPWP, which grew moderately for several years until 2001, have since picked up speed, growing by 48% over the five years to 2004. SPWP import growth was due to import increases by all of the top EU importers, contributing significantly to global trade expansion in these products. EU imports came mainly from other EU countries (notably Italy and Germany), Poland, China, Indonesia, Romania,

Vietnam, Brazil, Malaysia and the Czech Republic in 2004. EU-25 SPWP exports reached \$30.1 billion in 2004 following the accession of the 10 new European countries that year.

Table 5-1 shows that the EU countries continued to import a relatively small proportion (11% in 2004, down from 13% in 2000) of their SPWP from ITTO producer countries. Despite this small market share, imports from ITTO producers in 2004 surged 12% to almost \$2.9 billion, only 39% less than US imports from ITTO producers and more than double the value of Japanese SPWP imports from these countries. EU imports from ITTO producers have grown by 24% in the five years up to 2004, slower than the 45% growth in imports from ITTO consumers and the 48% overall growth rate. The EU is gradually increasing imports of SPWP at the expense of primary wood products and shifting manufacturing facilities to lower cost countries, mainly in Eastern Europe.

In Germany, the largest EU SPWP importer (\$5.7 billion in 2004) and a distant second to the US in global imports, only 7% of the market has been captured by ITTO producers (up from 6% in 2003) and 44% by ITTO consumers. Germany (along with several other EU members) imports substantial quantities of SPWP from Eastern European countries (notably Poland), which accounts for the lower contribution of SPWP imports from ITTO consumers. Imports from these non-ITTO sources have seen rapid growth over the past years. Once the new EU members accede to the ITTA, 2006 and become ITTO consumer members, Germany's imports from other consumer countries will rise to close to the average for other consumers of around 70%.

The UK followed Germany closely as the world's third largest importer of SPWP in 2004. The UK has seen a steady growth of SPWP imports over the last several years, which helped it to overtake Japan for third spot in 2001. The UK imported almost \$5.7 billion of SPWP in 2004, up 26% from 2003 and twice its imports in 1999. The UK appears set to overtake Germany soon as the world's second largest importer of SPWP. Steady growth in UK SPWP imports were due to a robust economy and housing market. Tropical countries, however, accounted for only 13% of the UK's SPWP market in 2004, down from 19% in 2000. UK SPWP imports came predominantly from the EU (notably Italy), China, Malaysia and Indonesia.

Table 5-1 shows that France became the fourth largest global SPWP importer after overtaking Japan in 2004. French SPWP imports jumped 23% to over \$4 billion in 2004, 55% higher than in 2000. France's main SPWP suppliers in 2004 were other EU countries (notably Italy and Poland), China, Romania, Indonesia and Brazil.

Japan, formerly the world's third largest SPWP importer until 2000, fell to the fifth place in 2004 despite a 16% SPWP import increase. However, ITTO producers hold a larger share of the Japanese market than they do for any other major market, with almost one-third of Japan's \$3.8 billion SPWP market provided by these countries in 2004. Most Japanese SPWP imports came from China (41% of Japanese SPWP imports), the EU (notably Italy), Indonesia, Thailand, the Philippines, Malaysia and Vietnam in 2004. The market share of ITTO producers, however, has been declining since 2000 (when it was over 35%) due to a growing gain in market share by China and other ITTO consumers.

Canada overtook the Netherlands and Belgium in 2004 to become the world's sixth largest importer of SPWP at over \$2.1 billion. Canada is the only major market where ITTO producers have gained market share, growing from 12% in 2000 to 15% in 2004. Belgium, Switzerland and the Netherlands are the world's seventh, eighth and ninth largest importers of SPWP. ITTO producers account for 12%, 1% and 21% of the SPWP markets in these countries, respectively. China, formerly a major importer, has been displaced from the top ten importer's list and is now the world's largest exporter of these products.

While transportation costs, tariff levels and regional marketing relationships play a role in the differences in market share held by ITTO producers in the major import markets for SPWP, there is clearly a substantial opportunity for all producing countries to increase their market share, particularly in the huge and growing market for these products in Europe.

The breakdown of SPWP imports by major product categories is presented in Table 5-2. Just under two-thirds of SPWP imports by ITTO consumers were wooden furniture. Other SPWP (15%) and builder's woodwork (14%) were far behind as the second and third most valuable types of SPWP imports. Over half of EU wooden furniture imports came from other EU countries in 2004. The UK, France and the Netherlands had the greatest proportion of wooden furniture in

their SPWP imports at 68% or over in 2004. The USA was the world's largest single importer of wooden furniture (and all other SPWP categories), with over \$14.1 billion worth entering the country in 2004. The USA imported most of its wooden furniture from China (43% of total imports), Canada and Italy in 2004. Italy was its main supplier of upholstered furniture while Asia (notably China) was its main supplier of ready-to-assemble furniture. US tropical furniture imports came primarily from Malaysia, Mexico, Indonesia, Thailand, Vietnam and Brazil in 2004.

Table 5-3 in Appendix 5 shows the top tropical importers of SPWP ranked by 2004 values. As many ITTO producer importers were tiny importers of these products, this table also contains important non-ITTO tropical countries, including countries with more than 50% of the land area in the tropics, such as Oman. In 2004, the top twelve tropical countries accounted for under 2% of global imports of these products. The eight of these countries that were ITTO producers accounted for 88% of total ITTO producer imports of SPWP in 2004, up from 81% in 2000. While still tiny compared to the major importers shown in Table 5-1, SPWP imports by several ITTO producers were becoming relatively significant despite generally high tariff levels on these products. The proportion of ITTO producer imports coming from other producers has risen rapidly since 2000 while the value of imports from ITTO consumers has been declining.

Mexico was by far the largest ITTO producer importer and tropical importer of SPWP, with \$410 million in 2004, mostly from ITTO consumers (82%). Mexican SPWP imports accounted for 44% of the SPWP imports by ITTO producers. Mexico's imports of SPWP come predominantly from USA, China, Italy and Brazil. Singapore, Malaysia (20% each of the 2004 ITTO producer total) and India (6%) are other significant tropical importers of SPWP. Angola, Thailand and the Philippines followed India with SPWP imports between \$50 and \$51 million. SPWP imports of ITTO producers grew by 11% between 2000 and 2004 helped by import increases of 190% in Malaysia, 159% in India, 136% in Thailand, 42% in Panama and 28% in Mexico, despite declines of 44% in Venezuela and 4% in the Philippines.

Malaysia's SPWP imports, which climbed 62% in 2004 to over \$186 million, came mostly from the EU (notably Germany), China, Poland and Indonesia. India's SPWP imports have grown

almost three-fold in the last five years, which enabled it to overtake Angola in 2004. Thailand's SPWP imports have also been expanding steadily over the five years up to 2004. Thai SPWP imports jumped 35% in 2004 and the country is also set to overtake Angola. After sharp import declines during 2001-2002, the Philippines' SPWP imports rebounded by 31% in 2004. The Philippines' SPWP imports came mainly from China and Malaysia in 2004.

Table 5-4 presents a breakdown of the categories of SPWP imported by major tropical importers. ITTO producers imported \$507 million worth of wooden furniture in 2004, the main category at 54% of all SPWP imports. Around 66% of producers' wooden furniture imports were from ITTO consumer countries. In contrast to other tropical importers, Mexico, Malaysia, Thailand and the Philippines import relatively high quantities of other SPWP (packaging, pallets, casks, etc.) compared to their wooden furniture imports. Mexico was the largest tropical importer of wooden furniture (\$188 million or 46% of all Mexican SPWP imports), other SPWP (\$111 million), mouldings (\$71 million) and builder's woodwork (\$32 million). Singapore was the largest tropical importer of cane and bamboo furniture and parts (\$28 million).

Malaysia was, after Mexico, the second largest ITTO producer importer in every category of SPWP, except builder's woodwork and cane and bamboo furniture and parts, of which Thailand and India, respectively, import more. Oman had the greatest proportion of wooden furniture in its SPWP imports at 83% in 2004, while Barbados was the only top tropical importer that had a greater proportion of imports of mouldings (41%) than of wooden furniture or other SPWP.

### **Major Exporters**

Table 5-5 shows the top exporters of SPWP ranked by value in 2004. ITTO consumers totalled \$42.2 billion of SPWP exports in 2004, accounting for 67% of aggregate world exports, down from 69% in 2000. With SPWP exports of \$9.5 billion in 2004, China was again the world's largest exporter of SPWP after overtaking Italy in 2003. This figure accounted for almost one-quarter of ITTO consumer SPWP exports, up from 14% in 2000. The strong upward trend of growth in China (including Hong Kong and Macao S.A.R.s) has been evident since 1990 and it has steadily climbed in the rankings of top exporters, overtaking Germany as the world's third largest exporter in 1997 and Canada as the

world's second largest exporter in 2000, before displacing Italy from the top position. China's SPWP exports climbed 27% in 2004 and have more than doubled over the 2000-2004 period. China's rapid growth has been helped by its booming exports of wooden furniture to the USA, which absorbs almost half of Chinese SPWP exports (see below). Many companies from the USA, Taiwan P.O.C., Singapore and other traditional Asian producers continue to establish furniture and other SPWP joint ventures in southern China because of the low wages and policies encouraging downstream timber processing. SPWP manufacturers based in China have been successful in penetrating high-value markets such as Japan, and, particularly, the USA with their furniture.

Table 7 shows the breakdown of Chinese imports and exports based on data available in COMTRADE. The table shows that 91% of China's exports of SPWP in 2004 originated from mainland China (up from three quarters in 2001), while 91% of China's imports flowed to or through Hong Kong. Taiwan P.O.C. was also a significant exporter, with around \$450 million worth in 2004.

Italy's SPWP exports were relatively stable at just over \$6 billion between 1995 and 2002. Italian SPWP exports were affected by often unfavourable euro/dollar exchange rates during this period and strong competition from China and elsewhere which led to widespread decreases in market share. Despite these market share declines, Italy's SPWP exports still grew by 10% in 2003, when it was overtaken by China, and a further 11% in 2004 to a record \$7.6 billion. Around 79% of Italian exports were absorbed by other ITTO consumer countries, predominantly fellow EU members (led by France, UK and Germany) and the USA. Italy's exports comprised just under one-third of the \$24.4 billion worth of EU SPWP exports in 2004 (EU-25 SPWP exports reached \$33.6 billion that year). The EU-15 accounted for 58% of ITTO consumer country exports of SPWP in 2004.

Canada is the world's third largest SPWP exporter, after China and Italy. Canada's SPWP exports grew 14% to \$5.2 billion in 2004. Canada's upward export trend has been largely due to increased exports to the booming USA market which absorbs virtually all Canadian SPWP exports. Germany (the world's fourth largest SPWP exporter) and Poland (fifth) were also major exporters of SPWP in 2004. German

		<b>Imports</b>		<b>Exports</b>

	ITTO Cons.	1,081,571	(93)	8,870,979	(93)

Note: Exports from Hong Kong and Macao S.A.R.s include re-exports as per COMTRADE definition; reported Chinese exports to both were minor.

SPWP exports have recovered in recent years together with its economy, growing by 52% through 2000-2004, while Polish SPWP exports have doubled during the same period. Poland's SPWP exports, which go primarily to Germany (43%) and other EU countries, is rapidly approaching Germany's export levels. Poland's wood processing sector has been substantially privatized and German investment has helped develop it into one of the three largest in Europe. Polish furniture exports are largely produced in wholly or partially German owned factories.

Indonesia and Malaysia, the world's seventh and ninth largest SPWP exporters, remained the only ITTO producer countries among the world's top exporters. Indonesian SPWP exports, which contracted in 2001, have been growing since 2002 to reach over \$2.5 billion in 2004. Indonesia shipped nearly three-quarters of its SPWP to the EU, USA and Japan in 2004.

Malaysia's SPWP exports, growing gradually since late 1980s, fell briefly in 2001 before rebounding and growing to just under \$2 billion in 2004. Malaysia's SPWP exports grew by 20% between 2000 and 2004, outpacing Indonesia's 13% growth. Malaysia is set to overtake the USA as the world's eighth largest SPWP exporter. Most of Malaysia's SPWP exports went to the USA, the EU and Japan in 2004. Indonesian and Malaysian SPWP exports continue facing fierce competition from China in the US, EU and Japanese markets.

The breakdown of SPWP exports by major exporters in 2004 is illustrated in Table 5-6. Around 60% of world's SPWP exports consisted

of wooden furniture, mostly shipped to ITTO consumers. Builder's woodwork (16%) and other SPWP (14%) were far behind as the second and third most important SPWP export categories. Italy remained the world's largest exporter of wooden furniture, at over \$6.3 billion in 2004, and the world's second exporter of cane and bamboo furniture after China. Italy has been particularly successful in furniture markets because of its high-quality, fashionable designs, skilful labour, state-of-the-art technology, good service and exceptional access to high-value markets. Upholstered furniture and chairs constitute the main type of wooden furniture exported by Italy. The Italian furniture sector remained, nevertheless, under increased pressure from competitors (notably China and Eastern Europe), particularly with a strong euro. In the USA, its number one market, Italy has lost share to China and Canada. In Germany, its second furniture market, Italian manufacturers have faced increased competition from Poland and the Czech Republic. Italian furniture manufacturers were striving for product diversity and design, and production innovation to cope with increased competition. Italy has gained market share in other markets, however, notably in Russia. Russia is now Italy's third furniture market, after the EU and USA.

China is the world's second largest exporter of wooden furniture, and is rapidly narrowing the gap with Italy. China leads the exports of other SPWP (packaging/pallets, casks, barrels and others) and cane/bamboo furniture and parts. China has seen an impressive upward trend in furniture production driven by strong growth in both furniture exports and domestic consumption.

From 1995 to 2004, the total value of wooden furniture exports rose six-fold from \$932 million to \$5.7 billion, and wooden furniture exports accounted for only about one-quarter of China's total furniture output in 2004. China's furniture was exported mainly to the USA (around 50% of all exports), the EU and Japan, with substantial re-exports reported by Hong Kong as transiting through its S.A.R. (note that China's export figures don't show this flow). Markets are also being developed in other countries around the world. Many US manufacturers have outsourced the production of semi-finished components or nearly finished furniture pieces to Chinese Original Equipment Manufacturers (OEMs), with only final finishing to high US market standards carried out in their own plants. Most Chinese exports to the USA are now from OEMs. Since 2001, China has replaced Canada as the leading supplier of furniture to the USA.

The rapid growth and low prices of Chinese exports has led to concerns in major markets. In mid-2004, the US Department of Commerce imposed anti-dumping duties ranging from 4.8% to 198% on Chinese wooden bedroom furniture imported into the USA. Although the growth of bedroom furniture imports from China slowed, the net effect of this ruling had a limited impact on sales as even with the imposed tariffs, furniture manufactured in China still was priced more competitively than US-manufactured products.

Turning to the other types of SPWP, Canada was the world's largest exporter of builder's woodwork and the world's second largest exporter of mouldings after Indonesia. Compared to many other exporters, Indonesia has a more balanced portfolio of export products. The major categories of Indonesia's exports were wooden furniture (38%), builder's woodwork (23%), mouldings (15%), cane and bamboo furniture (13%), and other SPWP (10%). Indonesia was the world's largest exporter of mouldings and the largest tropical exporter of builder's woodwork and cane/bamboo furniture in 2004. Indonesian wooden furniture is made of timber species such as meranti, rubberwood, mahogany, bangkirai, agathis and nyatoh. Around half of this is produced in the greater Jakarta area and the other half in East Java. Rattan furniture and parts are exported from Sumatra and Kalimantan. However, most Indonesian rattan is exported unprocessed to the furniture industries of Hong Kong and Singapore.

Malaysia's exports of wooden furniture make up the bulk of its SPWP exports (72%). Malaysia is the world's sixth largest exporter of wooden furniture and the largest supplier among tropical producers. About 70% of Malaysian furniture is manufactured from rubberwood, which has been successfully marketed in the USA, the EU and Japan. Policies in the country favour further processing, restricting exports of raw rubberwood.

Cane and bamboo furniture exports from ITTO consumers were over \$1.05 billion in 2004, compared to only \$490 million in total exports of these products by all ITTO producer countries. China was the only consumer country with substantial production and exports of cane and bamboo furniture based on domestic raw materials. Removing China's exports from the ITTO consumer total still leaves \$630 million of consumer country exports based largely on imported raw materials, illustrating a potential market opportunity for producer countries.

Table 5-7 shows other top tropical exporters of SPWP (apart from Indonesia and Malaysia reported in Table 5-5) ranked by value of 2004 exports. Brazil, Thailand, Vietnam, Mexico, the Philippines and India were other major tropical exporters of SPWP, all with exports over \$340 million. Seven of the countries in Table 5-7 were ITTO producers, which, together with Indonesia and Malaysia, accounted for 98% of total ITTO producer exports of SPWP in 2004. ITTO producers accounted for 16% of world SPWP exports in 2004, down from 17% in 2001. ITTO producers' exports of SPWP amounted to over \$9.9 billion in 2004, up 23% from 2003 due to increases in exports from the top four major producer exporters, in response to increased demand for SPWP in the USA and (to a lesser degree) Europe. The increased focus on SPWP production and exports in many tropical countries also played a role in doubling the value of SPWP exports by ITTO producers between 2000 and 2004. However, ITTO producers' market share in the global market shrank from an average 1.5% in 2000-2003 to 1.4% in 2004, due mainly to market share gains by China.

Brazil's SPWP exports have also been booming in recent years. Since 1998, its SPWP exports have grown almost four-fold to nearly \$1.8 billion in 2004, after overtaking Mexico in 2001 and Thailand in 2003 to become the third largest tropical exporter. Brazil is rapidly approaching Malaysia's SPWP export level and soon it may

join it and Indonesia on the list of the world's top exporters. Brazil's SPWP exports, mainly to the major markets of the USA, Europe and Latin America (notably Chile and Mexico), include significant amounts of pine and other species from its non-tropical south.

Thai exports of SPWP contracted in 2001 and 2003, affected by the slowdown in the US economy in 2001 and fierce competition for SPWP markets from China in both years. Thai exports rebounded by 22% in 2004, however, due to a boost in the exports of wooden furniture and parts. Thailand, like Malaysia, has also linked the development of its furniture industry to its rubberwood resources. The ban on logging in Thailand's native forests imposed in 1991 has increased its dependence on imports as well as on former rubber plantations for wood supplies. Policies favour further processing over exports of rubberwood logs and sawnwood. Thai SPWP exports go mainly to the markets of the USA, Japan and Europe.

Vietnam's SPWP exports continue to boom as the country consolidates as a competitive source of SPWP. Vietnam's SPWP exports of nearly \$1.3 billion in 2004 were up five-fold from 2000 and double the level of 2003. Vietnam overtook the Philippines in 2002 and Mexico in 2004 to become the fifth largest tropical exporter. This sharp upward export trend was the result of a bilateral trade agreement signed with the USA in 2000 and the anti-dumping tariffs imposed by the USA on China's wooden bedroom furniture in 2004. Vietnam's exports went mainly to the EU, USA and Japan in 2004. However, Vietnam's SPWP production is heavily dependent on timber imports, with over 80% of the wood processed being imported. Timber (notably sawnwood) is imported mainly from nearby countries such as Laos, Cambodia, Malaysia, Myanmar and Indonesia as well as from more distant countries like the USA, New Zealand, Finland and Sweden.

Mexico was the sixth largest exporter of SPWP in the tropics in 2004, although a large part of its exports come from its temperate coniferous forests. Mexico's SPWP exports grew gradually until 2000 to over \$1.1 billion, before falling to just over \$900 million between 2001 and 2003 due to a slowdown in the USA, its main trading partner, and mounting competition from Chinese furniture. Mexican exports rebounded 9% to \$986 million in 2004. Other tropical Latin American SPWP exporters were minor compared to Brazil and Mexico.

The Philippines' SPWP exports also rebounded in 2004. Filipino SPWP exports had grown continuously to reach \$484 million in 2000 but fell to around \$330 million between 2001 and 2003. The Philippines' exports bounced back in 2004 by almost doubling to \$586 million.

Table 5-7 also shows that Asia-Pacific was by far the dominant exporting region in the tropics (69% of all ITTO producers' SPWP exports in 2004), with Latin America (primarily Brazil and Mexico) a distant second (28%). Although still minimal, value-added processing in the African region grew gradually until 2000, fell in 2001-2002, resumed its upward trend in 2003 and reached \$92 million in 2004. The relatively low level of SPWP exports from Africa has been due largely to a lack of investment and infrastructure. Nevertheless, many African governments such as Côte d'Ivoire, Ghana, Nigeria and Cameroon were making the development of secondary processing of timber a priority. Côte d'Ivoire and Ghana made up the bulk of SPWP exports from Africa in 2004. African SPWP exports were mainly directed to the EU (notably Italy, France and the UK) and US markets. Despite African policies to increase SPWP exports, the relative share of SPWP exports between the main tropical regions is unlikely to change significantly in the medium-term as countries in all three regions continue to express their desire to further expand downstream processing capacity.

Table 5-8 provides a breakdown of the categories of SPWP exports for major tropical exporters. Almost half of ITTO producers' exports of SPWP consisted of wooden furniture in 2004. However, the main types of SPWP produced and exported vary significantly from country to country.

The major categories of Brazilian and Latin American SPWP exports in 2004 were wooden furniture (44%) and builder's woodwork (25%). Brazil was the second largest exporter of builder's woodwork, other SPWP and mouldings among tropical countries. Most of Brazilian export furniture is made from solid pine and reconstituted panels. Brazil's southern states of Santa Catarina, Rio Grande do Sul and Parana are the country's leading furniture producers. While most of Brazil's wooden furniture exports are non-tropical, tropical SPWP exports are also growing. Tropical exports of furniture and other SPWP mainly originate from the northern Brazilian state of Para and have been growing since 1999. Brazil was fast gaining a share in the supply of wooden furniture (particularly bedroom

categories) to the USA. From 2004, all Brazilian furniture started bearing a seal of guarantee granted by the Brazilian Association of Furniture Industries (ABIMOVEL) aimed at stimulating exports.

Thailand was the largest tropical exporter of other SPWP and the third largest tropical exporter of furniture, after Malaysia and Vietnam. Like Malaysia, Thailand has successfully penetrated high value markets, particularly in Japan, with rubberwood furniture. The rapid growth of Chinese furniture exports is an on-going concern to Thailand and many other producer country exporters. China replaced Thailand as Japan's largest furniture supplier in 2000 and continued rapidly gaining market share in other major markets.

Vietnam's SPWP export boom has largely been based on furniture, the major category (87%) of its SPWP exports in 2004. Production costs in Vietnam were reportedly even lower than in China, attracting significant foreign investment including from furniture manufacturers in China.

The main categories of Mexican SPWP exports were wooden furniture (69%) and other SPWP (17%). Most of Mexico's furniture and other SPWP exports are shipped to the USA, its main trading partner. The Philippines' SPWP exports were mainly wooden furniture (36%), builder's woodwork (32%) and cane and bamboo furniture (18%, the second largest supplier in the tropics after Indonesia). The Philippines had the greatest proportion of builder's woodwork in 2004.

Table 5-8 also shows that the major category of Africa's negligible SPWP exports in 2004 was mouldings (73%). This is in contrast to other tropical regions where this was one of the smallest components of SPWP trade and may indicate a possible market niche for African exporters. Mouldings are the first step in further processing and also the first component of more elaborate goods. Côte d'Ivoire and Nigeria were the largest ITTO exporters of mouldings in Africa and their exports go mainly to Italy. Ghana was the largest ITTO exporter of furniture in Africa, mainly to the UK market.

To put ITTO producer exports into a global perspective, the combined value of SPWP exports from all ITTO producer countries was only 4% greater than China's exports of SPWP to global markets in 2004. While China's leading position in SPWP markets appears unassailable, it is worth

recalling that producer countries have recently made up substantial ground on other major exporters like Italy. In the mid-1990s, Italian shipments of SPWP to the world were almost double those of all ITTO producers but now they are about 25% smaller than total producer exports. Producer countries will need to focus on quality and relentlessly reduce costs if they hope to make a similar gain on China's position.

Growth in SPWP exports by producer countries has been impressive in recent years, but their 16% contribution to total SPWP imports by ITTO consumers in 2004 was still small. Although developing countries enjoy some degree of tariff relief under the Generalized System of Preferences (GSP) or other schemes for SPWP in many of the major markets, these benefits have been eroded (relative to the trade terms offered to non-GSP countries) by general tariff reductions in many countries through successive rounds of multilateral and bilateral trade negotiations. Tariffs in many countries remain high, however, compared to those for primary products like logs and sawnwood. The EU, Japan and the USA apply no import tariffs on SPWP from GSP countries, while rates for most other countries range from 2 to 6% on the major product categories. In contrast, some developing countries retain high import tariffs on SPWP, partially accounting for the relatively low import levels shown for producer countries in Table 5-3.

The development of new processing technologies (e.g. MDF, veneer lamination) and raw material supplies (e.g. rubberwood) allow the use of a wider range of tropical wood species in furniture and other SPWP production in ITTO producer countries and consequent increases in production and exports. In 2005, world GDP growth was expected to increase, with accompanying growth in international trade of manufactures including SPWP. The contribution of SPWP to the forest sectors of ITTO producers and other developing countries will continue to grow, with corresponding reductions in production and especially exports of primary tropical timber products.

### **SPWP Trade Discrepancies**

The types of anomalies identified for primary products trade statistics in the previous chapter also exist in COMTRADE statistics for SPWP reported by trading partners. The statistics reported by the major exporters of SPWP in Table 5-7 who reported data to COMTRADE can

differ substantially from the corresponding import values reported by the major importers of SPWP in Table 5-1. Discrepancies in trade figures can be due to a number of factors as identified in the previous chapter: partial or non-reporting of exports to COMTRADE; differences in reporting periods; exchange rates disparities; transfer pricing; etc.

Table 8 compares the different values reported by five major exporters of SPWP plus aggregate producer exports (in italics) with the import statistics recorded in COMTRADE for the EU, the USA, Japan and all ITTO consumers (in bold). Table 8 shows that China's export figures still hold huge discrepancies with the EU (80%) and the USA (86%), for an overall 56% discrepancy with ITTO Consumers' import figures in 2004. The large discrepancies in reported SPWP trade flows by China and its trading partners are a serious concern. They may reflect the costs of duties imposed by the EU and the USA but this needs to be investigated further. Table 8 further illustrates that the problems identified for primary products for Indonesia also held for SPWP, with, for example, 71% and 36% discrepancies with EU and US import figures for an overall 20% discrepancy with ITTO consumers' import figures.

Thailand, the third largest SPWP exporter after Indonesia and Malaysia, did not report export statistics to COMTRADE in 2004 so it could not be included in Table 8 this year. Malaysia's reported 2004 exports showed 11% and 21% discrepancies with EU and US import figures, while its discrepancies with Japan's and ITTO consumers' import figures showed an opposite pattern (-11% and -3%, respectively). Brazil's SPWP trade figures are broadly in line with figures reported by major trading partners.

Discrepancies up to 20% can be largely attributed to insurance, freight and other shipping costs included in import values, but negative discrepancies (export values larger than imports) are harder to interpret. The negative discrepancies between EU and ITTO consumer countries may be due to different protocols for reporting intra-EU trade amongst member countries.

### SPWP Prices

Appendix 4-4 contains real and nominal price graphs for Malaysian and Indonesian secondary processed sawnwood (mouldings) as well as for Malaysian furniture parts and selected rubberwood furniture items from mid-1997 to 2005, based on the nominal prices reported by the ITTO MIS. Nominal prices (normal lines in the graphs) were deflated or converted into constant (or real) 1990 prices (bold lines) using the IMF Consumer Price Index (CPI) for industrial countries.

Prices for SPWP have generally been more stable than prices for primary products. Real export prices of Malaysian mouldings still plunged by 22% during the Asian financial crisis (compared to up to 37% for Asian tropical logs) and were then stable or declining until mid-2004. Red meranti mouldings Grades A and B traded at real prices between \$443-\$511/m<sup>3</sup> and \$359-\$409/m<sup>3</sup> through that period, still much lower than 1996-97 price levels. Prices for these products rose sharply in the second half of 2004, reflecting price increases in meranti products as a result of reduced log supplies. Red meranti mouldings Grades A and B were stable or slightly rising in 2005 and traded at \$477/m<sup>3</sup> (\$668/m<sup>3</sup> nominal), and \$406/m<sup>3</sup> (\$568/m<sup>3</sup> nominal), respectively, at the end of the year.

	<i>4,290,966</i>	<i>588,214</i>	<i>642,349</i>	<i>1,028,979</i>	<i>4,204,900</i>	<i>2,201,315</i>	<i>11,649,962</i>
<b>Japan</b>	<b>1,573,777</b>	<b>391,615</b>	<b>198,669</b>	<b>15,018</b>	<b>1,179,068</b>	<b>538,644</b>	<b>2,335,546</b>
	<i>1,315,336</i>	<i>345,762</i>	<i>223,235</i>	<i>13,725</i>	<i>1,151,706</i>	<i>513,471</i>	<i>2,014,869</i>
<b>ITTO Cons.</b>	<b>13,798,528</b>	<b>2,671,944</b>	<b>1,571,528</b>	<b>1,662,170</b>	<b>9,392,194</b>	<b>18,135,195</b>	
	<i>8,870,979</i>	<i>2,224,784</i>	<i>1,613,427</i>	<i>1,598,323</i>	<i>8,911,131</i>	<i>21,078,046</i>	

After the Asian financial crisis in 1997-98, prices for Indonesian SPWP were relatively stable or declining until early 2004. Indonesian red meranti mouldings Grades A and B traded at real prices between \$379/m<sup>3</sup>-\$474/m<sup>3</sup> and \$317/m<sup>3</sup>-\$372/m<sup>3</sup> through that period. Prices for both grades of Indonesian red meranti mouldings were up to 14% and 10% lower than the corresponding Malaysian products in those years, respectively. Price declines for these secondary products were caused by strong price competition between manufacturers in China, Indonesia, Malaysia, Thailand and Vietnam in the face of decreased demand. However, prices for both grades of Indonesian mouldings surged in the second half of 2004 reaching \$452/m<sup>3</sup> (\$620/m<sup>3</sup> nominal) and \$379/m<sup>3</sup> (\$520/m<sup>3</sup> nominal) by year-end, approaching the price levels of competing Malaysian products. Prices for Indonesian mouldings Grade A and B were relatively stable or rising in 2005 and traded at \$452/m<sup>3</sup> (\$633/m<sup>3</sup> nominal) and \$388/m<sup>3</sup> (\$543/m<sup>3</sup> nominal) late that year.

Real prices for Malaysian selangan batu decking declined from 2001 and reached a low of \$394/m<sup>3</sup> (\$540/m<sup>3</sup> nominal) in early 2004. Selangan batu decking prices have risen slowly but steadily since then and through most of 2005. Selangan batu decking was traded at \$441/m<sup>3</sup> (\$618/m<sup>3</sup> nominal) by year-end.

Appendix 4-4 also shows prices from late 1997 or later for Malaysian furniture (windsor chairs of rubberwood) and furniture parts (two grades of rubberwood table tops). Prices for Windsor chairs and lower grade (semi-finished) rubberwood table tops are given per piece, while those for top grade rubberwood table tops are quoted on a volume (m<sup>3</sup>) basis.

Real prices for semi-finished dining table tops (solid rubberwood laminated), rubberwood windsor chairs and top grade rubberwood table tops were, like most other Malaysian forest products, severely affected by the Asian financial crisis. By mid-1998, prices for the first two products, in particular, had plunged by 40% and 25%, respectively, to \$25 (\$30 nominal) and \$7 (\$8 nominal) per piece. Prices of these products have continued to decline since then and reached lows of under \$15/piece and \$6/piece in late 2001 or later. Prices for these two products improved slightly in 2003-2004 and were at \$16/piece (\$22/piece nominal) and over \$6/piece (\$9/piece nominal), respectively at the end of 2004. Prices for windsor chairs remained relatively stable at that level in 2005 before declining to just under \$6/piece (\$8/piece nominal) by year-end. In contrast, prices for rubberwood semi-finished dining table tops contracted sharply in the second half of 2005 and were trading at \$14/piece (\$20/piece nominal) late that year. Manufacturers of these rubberwood furniture components continued to absorb the increasing costs of rubberwood raw material, which was in increasingly short supply in 2004-2005. Increased raw material costs and declining export prices have put pressure on manufacturers of these products.

Prices for top grade sanded and edged rubberwood table tops dived by 26% between mid-1999 and mid-2001 when they reached lows of \$366/m<sup>3</sup> (\$475/m<sup>3</sup> nominal). Prices fluctuated around that level from then onwards until late 2003. Real prices for this product rose in the first half of 2004 to reach \$399/m<sup>3</sup> (\$548/m<sup>3</sup> nominal) in mid-2004 and declined slowly but steadily since then and through most of 2005. This product ended 2005 trading at \$379/m<sup>3</sup> (\$530/m<sup>3</sup> nominal).

## 5. COUNTRY NOTES

The following notes provide details of relevant recent developments in ITTO member countries, including information on trade barriers, new or increased processing capacity, trans-national forestry investment, the role of forest plantations in wood supply, forest law enforcement activities and domestic economic trends, as solicited through the Joint Questionnaire. Where possible, they are supplemented by information from other sources; nevertheless, the quality and length of these notes are determined largely by the quality and length of the original submissions by members. Due to the availability of relatively more accessible information in other sources, no effort was made to supplement (the scant) information provided by consumer countries on these topics, which is presented as provided in the 2005 JQ. Most of the information presented here for producer countries is as of mid-2005, although selected information considered relevant for some countries has been repeated from the 2004 Review when no new information or the same information given previously was provided. Countries for which the majority (or all) of the information was provided in last year's Review are denoted by "(2004)" after the country name.

### Africa

#### *Cameroon (2004)*

The logging and marketing of logs are subjected to quota measures as follows: 30% of harvested logs are to be used for export and 70% for local processing in all logging companies. As an incentive measure, the granting of export permits to a number of companies should have an impact on timber production and trade in Cameroon in the future.

In accordance with Law 34/01 of 20 January 1994, all logging companies are allowed to export 30% of logs within the five years following company establishment. After the five-year duration, 100% of export logs are to be processed locally. However, the export of a number of lesser-known species is allowed for promotion in the international market.

Cameroon's economy is recovering. Public work is resuming along with its large consumption of lumber. However, aluminium is proving to be more expensive than local timber for construction and the substitution rate remains low. Timber

product consumption is increasing in urban areas, especially fuelwood and construction timber.

#### *Central African Republic (2004)*

The 2000 Budget Act allows a log export quota for every operator equivalent to that operator's export volume of sawn timber. Three sawmills were under construction in 2003.

Timber export duties and taxes are being regularly collected. Measures aiming at decreasing the delay in reporting by logging companies, reinforcement of controls on forest logging, establishment of temporary management conventions, suspension of cottage-type operation licenses and reintegration of contentious concession licenses into the National Forest Estate are steps currently underway that will impact timber production.

Decree N°91/018 of 2 February 1991 establishing the concession (license) granting system was revised in 2004. The obligations of companies now include justifying the establishment of production and processing units.

The main species marketed as logs are sapelli, ayous, sipo, kossipo, iroko and aniegre; as sawnwood: sapelli, ayous, sipo, kossipo, iroko and aniegre; and as plywood: ayous and sapelli. There are a total of 10 forest concessions in the country, some of which have foreign involvement.

The Central African Republic had 1 704 ha of forest plantations in 2004.

#### *Congo, Republic of*

There are plans to expand the production of roundwood, sawnwood, veneer and plywood as follows (1000 m<sup>3</sup>):

	2003	2004	2005	2006
Logs	1 200	1 300	1 400	1 600
Sawnwood	315	350	400	450
Veneer	26	32	40	62
Plywood	4	5	7.5	8.5

There are 11 national companies operating on 5 356 320 ha of forest concessions (59% of the total), 7 Asian-owned companies operating on 1 917 675 ha (21%), and 1 Libyan-owned company operating on 496 020 ha (5%). The rate

of foreign participation in Congo's wood processing sector is around 85%.

In Congo, the actual forest plantation surface area is 88 651 ha. The annual rate for plantation establishment is 1 418 ha/year. Production of plantation roundwood is reported to be approaching 300 000 m<sup>3</sup>.

#### ***Côte d'Ivoire (2004)***

The ban on exports of timber - logs, blockwares and cants - other than teak in force since 1995 is aimed at promoting local processing. Furthermore, in order to prevent excessive and uncontrolled logging, new logging of community teak is subject to specific approval by the Ministry of Water and Forests. It will, however, be necessary to reduce export duties in order to increase exports.

Under current policy, reforestation in proportion to logged volumes is mandatory for forest companies in order to ensure the sustainable supply of raw materials to local industries. Non-dried iroko sawnwood is also subject to an export quota. Following the evaluation of the forest sector in 1998, a Framework Programme for Sustainable Forest Management is under implementation. The programme, to be executed by a Technical Multidisciplinary Unit, comprises various projects, including those for the development of tropical timber processing capacities. Côte d'Ivoire is currently developing its National Timber Industrialization Plan.

Out of 400 potential species, about 60 are currently utilized. The enhancement of so-called lesser-known species is the trend but the promotion of these species is poor, especially since forestry research has presently stalled in Côte d'Ivoire.

Other than the traditional use of timber in roof framing, the use of timber as a major construction material is very scarce in Côte d'Ivoire. This is due to the fact that producers tend to apply export prices within the local market. In urban areas, the use of gas is becoming widespread to the detriment of charcoal and fuelwood.

More than 65% of the forest industries established in Côte d'Ivoire belong to foreigners, in particular French, Lebanese, Italian and Spanish nationals. Out of 30 000 employees, 25% are foreigners, and 85% of the capital stock

amounting to FCFA 70 billion is owned by foreigners.

The current military, social and political crisis in Côte d'Ivoire is having a negative impact on the timber economy. As a result, much data on the forestry sector is not available. The impact of the crisis on the 2004 statistical data will be greater.

Côte d'Ivoire has undertaken reforestation of 200 000 ha using species such as teak, frake, framire and cedrela. The annual extent of forest plantation development is about 10 000 ha. The production of plantation industrial roundwood averages 130 000 m<sup>3</sup> per year against a total annual production estimated at 2 million m<sup>3</sup>.

Côte d'Ivoire joined the World Conservation Union (IUCN) in 2004 as its 77<sup>th</sup> member country and its 28<sup>th</sup> African member country.

#### ***Gabon (2004)***

The export duty on tropical logs has been increased from 15% to 20% in order to reduce log exports. No export duty is applied to sawnwood, veneer and plywood, in order to encourage local processing and exports of processed products. In May 2003, an order was taken by the Ministry of Economy and Finance for the establishment, constitution and operation of a Commission for the monitoring and revision of administrative prices.

A quota has been fixed for each operator by the SNBG (Gabon's national timber company) for the production of okoume timber; sawnwood is subject to tax exemption; the granting of increasingly larger areas for the implementation of management plans in the case of a greater than 20-year cutting cycle was established by a new forestry law. As a deterrence measure, a 15% to 20% increase in export tariff rates for non-processed timber (roundwood) has been established. Monthly quotas on free log sales by each logging company have also been introduced. Reduced forest fees are being considered for companies engaged in sustainable forest management and timber processing.

All major forest companies with a forest concession covering 50 000 ha or more are obliged by law to submit a management plan for the allocated concession area and a timber processing plan within three months of signing a temporary Forest Management, Logging and Timber Processing Agreement with the Ministry

for Water and Forest Resources. Companies must also pay a land area tax of 600 francs CFA/ha under the terms of the 2002 Budget Act.

Changes taking place in the timber sector include rehabilitation of Owendo and Port-Gentil harbours, and restructuring of railway facilities to enhance transportation of forest products.

Apart from the main species such as okoume, padouk, kavazingo, etc., species such as white longhi, pao-rosa and beli are increasingly being used. In order to secure the sustainable supply of timber for future processing plants, the promotion of lesser-known and/or lesser-used forest species remains a short-term priority of the Department for Water and Forest Resources. Non-wood products such as rattan, charcoal and marantaceae leaves are harvested in quite substantial quantities on a national scale. Studies on the rattan industry have recently been conducted to evaluate its importance in terms of generated revenue. Specific regulations for this sub-sector are being developed. In the building sector, structural timber is produced from local products, while imported wood products (mostly non-tropical) are in great demand for furniture. It should be noted that strong competition of cement against timber exists in the construction sector, due to dissatisfaction with the perceived excessive cost of processed timber.

The major forest companies in the country are mostly subsidiaries of larger European firms, although Asian business concerns are becoming more prominent in Gabon's forest sector. Forest production areas totalling 11 316 304 ha were distributed as follows in 2004:

Temporary logging licenses:	38.6%
Industrial licenses:	42.85%
- granted to Gabonese:	18 (1 234 642 ha)
- granted to foreigners:	45 (3 317 534 ha)
Railways Vicinity Area plots:	18.55%

The net plantation area is estimated at 25 000 ha, but the actual extent is uncertain due to illegal clearing conducted by local communities.

### **Ghana**

The creation of Industrial Free Zones in parts of the country has attracted many timber processing mills some of which have relocated into such free zone enclaves to enjoy incentives and benefits related to direct and indirect taxes. The abolishing by Government of the Export Development and Reconstruction Levy has become a welcome

incentive to secondary wood product exporters. Under the Levy, export of sawntimber attracted payment of a 7% F.O.B. levy while the export of veneers and plywood attracted 3% levy. The recent European Market demand that all pallets and wood packaging materials should meet certain international phytosanitary requirements is expected to come into effect by September 2005. The timber industry has to adjust to this demand and obvious cost implications are yet to be assessed.

The provision of technical interventions aimed at improving the production capacity of small and medium scale timber processing facilities are being pursued.

The increasing unavailability of the traditionally popular timber species continues to stimulate industry's interest in the lesser-used and lesser known timber species. The lesser-used timber species are becoming increasingly prominent especially in the manufacture of panel wood products. However, opportunities exist for tertiary processing. Research has been also conducted in collaboration with TRADA for marine exposure trials on certain marine species. These include afina (*Trombosia* spp.), dahoma (*Piptadeniastrum ananta*), essa (*Celtis* spp.), denya (*Cylicodiscus gabunensis*), essia (*Combretodendron africanum*), kusia (*Sarcocephalus diderrichii*) and *Albizia* spp. It is expected that the research will eventually enhance their utilization.

Demand for housing outstrips supply and is on the increase. Plastic materials such as chairs, tables and other accessories are enjoying increasing use in homes, offices and public places. The use of metals/glass combined chairs, tables and other furniture in homes and offices are becoming the latest fashion. However the construction sector and real estate developers are increasingly making use of wood with some lesser used timber enjoying encouraging utilization.

The timber industry continues to be largely foreign-owned. The dwindling resource base has dictated virtually no investment in the secondary processing sector. Only limited investment has also been reported in the value added sector of the industry. The latter has resulted in the addition of two new products to the timber export line by the timber industry. These products are buttress veneer and burl veneers. Opportunities for joint ventures with the secondary processing sector will be going into downstream processing.

The past year has witnessed the tightening of measures to curb illegally sourced timber, particularly chainsawn lumber. Illegal timber in transit is usually confiscated by the state and legal action including fines imposed on offenders.

Efforts at national reforestation and tree planting are on-going. Apart from private sector and community involvement, there is a special Presidential Initiative on Tree Planting and forest plantation development schemes. The Ghana Timber Association (GTA), the umbrella organization for loggers in the timber sector, is also involved in plantation development on a commercial scale. A national tree planting target of 20 000 ha. annually is being pursued.

### ***Liberia (2004)***

The Government of Liberia levies a tariff rate of 5% on the CIF value of all timber and timber products imported into the country. Also, an inspection fee is levied based on container size (20' or 40'). The minimum amount per container is US\$250.00 payable to the Government.

Incentives are granted in packages and usually run from 5-10 years. Such incentives are renewable based on the volume of investment, especially in the area of increased level of industrialization. The incentives are:

1. Fiscal incentives - income tax holiday;
2. Duty and excise incentives;
3. Exemption of plant, equipment, etc. from customs duties;
4. Minimum taxation on processed/manufactured wood products for exports;
5. Tax exemption on petrol and fuel used for industrial purpose; and
6. Generous allowance for reinvestment or repatriation of profits.

The Environmental Protection and Management Law approved in 2003 stipulates that for every major investment that relates to the environment an Energy Information Administration (EIA) license must be obtained from the Environmental Protection Agency (EPA). It is believed that this will have some impact on forestry operations.

Each timber concession is obliged to process about 25% of their total production locally and is also encouraged to establish integrated wood-processing plants in strategic towns and cities throughout the country.

Prior to the imposition of the U.N. sanctions on log exports, 60 forest tree species were frequently harvested, of which lesser-used species accounted for about 75% of the total volume. The bush meat trade is increasing as well as the trade of minor tropical forest products such as rattan, bamboo, etc., used mainly for construction and furniture production.

The trend in domestic building activity is expected to increase due to a government reconstruction package. Both public and private home renovations are increasing as civil war-damaged buildings and homes are repaired. Besides aluminium (which is mainly used to make window and door-frames), wood products remain the principal construction material in Liberia.

The timber sector is dominated by Europeans, Asians, a few Lebanese, and Liberians. The level of investment by these groups is significant. Presently all concession holdings are under review and changes are expected. Therefore, all information related to concession holdings (including level of investment and nationality) is yet to be finalized.

The following laws have bearings on forestry operations such as roundwood production and exports:

- The Strategic Commodities Act 2000
- The Environmental Protection and Management Law 2000
- The Environmental Protection Agency Act 2003

The Forestry Development Authority (FDA) has collaborated with the U.N. Mission for Liberia (UNML) Civil Police Authority to train about 115 Regional Field staff members on forest law enforcement to curtail the destruction of the country's forests and associated resources prior to deployment of these staff in the 5 forest regions.

The FDA has established 10 690 ha of forest plantations from 1972-2003 and plans to increase the planting rate to address the shortage of fuelwood in urban and other localities.

### ***Togo***

Steps taken to enhance SFM in 2004-2005 include: recruitment of forest rangers and Forest Police; increase of control and trapping checkpoints; and initiation of several nurseries and private plantations. There is a proposal by

ODEF (state forestry administration) to acquire a portable sawmill.

A total of 19 tropical timber species are currently utilized in Togo. There is relatively little secondary processing. Wood use is declining due to competition with plastic and metal for chair manufacturing and the use of cement slabs as a substitute for timber framing.

The current area of forest plantations is 40 000 ha, with 600 to 1000 ha established annually. The share of industrial roundwood derived from plantations is only around 1%.

## **Asia-Pacific**

### ***Cambodia (2004)***

In order to encourage timber processing, all processed wood and non-wood products are exempt from taxes. Log exports are banned. The Government will provide further support for development of the forest sector by encouraging certification. Ten years after it first submitted its application, Cambodia joined the World Trade Organization (WTO) as its 148<sup>th</sup> member in September 2004.

The Government will increase tree plantations in order to enhance local wood supply. Increased domestic demand for housing will occur due to reforms which will reduce the size of the military forces, as former soldiers move from barracks to private housing. The Department of Forestry and Wildlife has established forest plantations of more than 8 000 ha, with an annual growth of 500 ha.

Illegal logging activities were detected in protected areas such as the Virachey National Park in Rattanakiri Province (10 800 ha) in mid-2004 after an aerial inspection. The World Bank and the World Wide Fund for Nature have funded the park's management and protection activities during 2000-2005 at a cost of approximately USD 5 million. An inter-ministerial committee was established in order to stop further illegal activity. Felled logs are believed to have been transported to Vietnam via Laos.

### ***Indonesia (2004)***

In order to halt the illegal flow of sawnwood, the Indonesian government has proposed a ban on exports. Targeted products are railroad sleepers, air-dried rough lumber (not including kiln dried), finger-jointed and moulded lumber. Other proposals to stop illegal logging activities have

been the application of the death penalty to those involved in the illegal activities, and the usage of a so-called "perpu" regulation - an emergency regulation that has legal force higher than a government ruling.

In efforts to decrease log smuggling through the Indo-Malay borders, Indonesia and Malaysia decided in December 2004 to carry out 'government-to-government' timber trade where only logs received through government designated ports would be considered legal. Indonesia estimates that approximately 2.8 million ha of forests are being cut-down and the resulting logs and forest products smuggled each year. It also predicts that at such a rate the country would lose all of its forests in the next 20 years. Other countries such as China, the EU and Japan have also agreed to only buy Indonesian timber from legitimate sources, although the pace of implementation of such agreements has been variable.

The Indonesian government has been seeking ways to reduce and restructure the timber industry, including reduction in installed capacity from 30 million m<sup>3</sup> to 20 million m<sup>3</sup>, reducing the annual allowable harvest to less than 6 million m<sup>3</sup> per year (although this proposed change has since been reversed), and increasing imports to supplement domestic log supplies. However, such changes would make nearly 50 000 timber industry workers in the Riau and Kalimantan regions redundant so the proposals are progressing slowly if at all.

To attract new investors, the industrial timber plantation regulations were revised in 2004 to allow private businesses to hold larger shares of co-owned plantations with state-owned businesses.

### ***Malaysia***

Current tariff rates are as follows (logs and sawnwood - tropical and non-tropical - attract zero tariff):

Veneer Tropical Face: 0% Core: 20%

Veneer Non-Tropical Face: 0% Core: 20%

Plywood Tropical: 25-40%

No other duties are imposed on imported tropical timber products except for minimal administrative fees imposed on imported timber (irrespective of source).

With the full implementation of SFM beginning year 2000, log production has been reduced significantly. Exports will be dictated by the

available log production volume in the future. For current restriction, log export is subject to availability of log export quota and the quota is only set at 1 000 000 m<sup>3</sup>.

Strategies incorporated in the short and medium term plan for expanding timber processing capacity are the provision of tax rebate or processing incentives to the millers and log producers, provision of land infrastructure, establishment of shipping facilities, and the set up of special areas for timber based activities namely TPZ (Timber Processing Zone).

Basically there have been increasing number of species being utilized and traded and this is very much the function of market demand and related to the general condition of the global economy.

With slight improvements in the global and local economic situation, there have been signs of an upward trend in construction activities notably pertaining to housing and real estate development.

In Sabah, involvement of foreign investor in wood processing industry is quite significant at 19.99% of the total investment in 2004 as follows:

Taiwanese - 72.96%, Japanese 9.47%, Singaporean 14.86%, Korean 1.69% and others 1.02%. Forest concessions are however owned 100% by locals.

Also in Sabah, forest fines and penalties collected in 2004 totalled RM 1 015 558 08. Arrested number of people: 207. Volume of timber confiscated in 2004: 38 469.08 m<sup>3</sup>. Other cases/offences of illegal possession, illegal cultivation, illegal entry, royalty evasion and others: 233 cases.

Planted forests play an increasingly important role ensuring that sustainable forest management is achieved. To support the development of planted forest, the state government has implemented two programmes. The first is the reforestation programme which is currently implemented by Forest Department, Sarawak. The second programme is the establishment of planted forest whereby licences are issued to the private sector whereby they are able to establish forest plantation.

### **Myanmar**

Import/export licences, timber production and timber products trade permits from the Ministry of Commerce are required to export wood

products. There are no quotas or incentives which affect production and trade. Suspension of GSP privilege by the US and the EU may be considered as a disincentive to forest development and management. No non-tariff barriers exist, except for the timber certification requirement which was not until now compulsory.

Private entrepreneurs are encouraged to undertake downstream processing. Private enterprises are further encouraged to use lesser-known species and to penetrate the world market. There are no short-term plans for expanding sawmilling capacity.

As a developing country, the domestic timber consumption has been increasing due to the development in infrastructure. However, some buildings are being constructed with cement and iron (mild steel rod).

Current Extent of Forest Plantations (Up to 2004) = 820,393 ha

Annual Establishment of Forest Plantation = 30350 ha

Proportion of Industrial Roundwood Production from Plantation = N.A.

### **Philippines**

Current tariff rates are as follows:

Logs Tropical: Free

Logs Non-Tropical: Free

Sawn Tropical: 7%

Sawn Non-Tropical: 7%

Veneer Tropical: 7%

Veneer Non-Tropical: 7%

Plywood Tropical: 15%

Plywood Non-Tropical: 15%

Incentives and disincentives for the forest sector include:

- a. Non tariff barriers include current export ban on logs coming from natural forests and lumber processed out of these logs, timber certification and illegal logging trade;
- b. Incentives to encourage establishment of timber plantations include exemptions on the payment of forest charges on products derived therefrom and free technical assistance from DENR;
- c. Income tax holidays, tax and duty free importation of capital equipment;
- d. Tax credit on domestic capital;
- e. Deduction of labour expenses after the tax holiday;

- f. Exemption from wharfage dues and export taxes and duties;
- g. Exemption from contractor's tax.

There is a decreasing trend in the number of operating sawmills and plywood plants in the last five years, with no plans to expand production capacities in the medium term. As of 2003, log production was 505 703 m<sup>3</sup>, of which: 27.5% was *albizzia falcataria*; 13.6% was *gmelina arborea*; and 12.2% was *acacia mangium*.

In 2000, the contribution of the construction sector to national income at 1985 constant price was Php 48 451 million. Lending rates based on savings time deposits and secured loans by commercial banks increased by 1.5% from 2000 to 2001.

Forest rangers are regularly deployed at specified checkpoints to detect and control transportation of illegally cut timber.

Total area planted in 2003 was about 15 088 ha. Total area planted by the government was 13 195 ha, while 1 893 ha were planted by the private sector (composed of timber license and industrial forest management agreement holders).

## Latin America and Caribbean

### *Bolivia (2004)*

In 2004, the Bolivian government gave local governments permission to use up to 20% of national forests for local groups' activities. It further waived 25% of forestry license fees paid to establish local forestry units to promote small-scale wood processing.

Under the FSC scheme, 1 million ha of Bolivian forests has been recognized in Europe as being sustainably managed. With more than one-half of this area located in the Amazon region, Bolivia is one of the countries with the largest areas of certified natural tropical forests.

The Madidi National Park, located in northeast Bolivia (18 957 km<sup>2</sup>), is being threatened by the communities of Apolo and Ixiamá who are opening a commuter road through the Park. It is predicted that this may attract illegal loggers who will have access to extract timber such as big-leaf mahogany (*Swietenia macrophylla*). The government together with the National Protected Area Service (SERNAP) has been negotiating with the residents of Apolo to reroute this road.

### *Brazil (2004)*

In April 2004, the Brazilian government reported that nearly 230 750 km<sup>2</sup> of Amazon forests were cleared between mid-2002 and early 2004, resulting in the second highest annual clearance rate ever recorded by the government. According to CIFOR, forests have been cleared as a consequence of Brazil's impressive economic growth, with growing beef and soya exports playing a large role.

Conservation International presented its new findings on Brazil's tropical savannah in 2004. It estimates that 7 222 square miles are being felled annually which at this rate will destroy the savannah by 2030. The findings also estimate that nearly 70% of the savannah has been turned into settlements and reservoirs for agricultural use.

In September 2004, IBAMA fined loggers R\$ 70 million during the Tauató Operation - a scheme funded by the federal government's Plan of Action for the Prevention and Control of Deforestation in Legal Amazônia. The 90-day operation confiscated 20 000 m<sup>3</sup> of lumber, 3 tractors and 6 chainsaws, and destroyed 5 logging camps. The operation successfully prevented the logging of approximately 100 000 ha in the Lábrea and Boca do Acre regions.

### *Colombia (2004)*

The tariff rates applied in Colombia are based on free trade treaties or trade agreements concluded with other countries, such as the Colombia-Chile Economic Complementation Agreement, signed in December 1993, which provides for a tariff relief program for 134 tariff items, including wood-based panels, for the period 2002-2006.

Through Decree No. 1989 of 2002, the Tax Refund Certificate (Certificado de Reembolso Tributario - CERT) has been replaced by a mechanism similar to those used by the Foreign Trade Bank for the provision of financial services and promotion of exports.

Incentives for timber production and trade are established by Act No. 788 of 22 December 2002, Article 18, item 6, which provides for tax exemptions for the harvesting of new plantations (including *Guadua* resources) and for investments in new sawmills directly related to the aforementioned projects. Furthermore, tax exemptions are provided to the owners of timber plantations that are duly registered with the competent authority. According to Art. 30,

roundwood (Nandina code 44.03) and nursery trees for timber plantation establishment (44.04) are tax exempt.

The Colombian commercial reforestation promotion policy for 2002-2006, which was approved through CONPES document No. 3237, establishes the necessary policy guidelines to guide government actions to encourage investments in forest plantations to ensure their sustained development and competitiveness. It is expected that by the end of the 2002-2006 period, the area of sustainable and competitive plantations will have increased by 80 000 hectares, thus contributing to the generation of 20 000 jobs in the production phase within the framework of National and Regional Competitiveness Agreements. The strategies established by CONPES Document No. 3237 include: 1) policy stability and institutional consolidation - the Ministry for the Environment, Development and Housing, in cooperation with the Ministry of Agriculture and the National Planning Department, will lead the process in the specific area of commercial and industrial forest plantations as part of a forest regulatory framework, defining and specifying institutional responsibilities, criteria and procedures for forest plantation establishment and harvesting and considering forest plantations as slow-yield crops; 2) direct and indirect incentives and financing systems - the policy supports the Forest Incentive Certificate to promote forest plantation establishment and provides for a rebate on income tax of up to 30% of the investment as an incentive to encourage investments in new plantations. In addition, for those companies that were legally constituted before the promulgation of the law and whose only objective is reforestation and sustainable forest harvesting, the government will issue an insurance policy with an insurance company as a guarantee to cover the total investment value based on a commercial valuation of investments; 3) strengthening of research, technological development and training - the strategy is aimed at strengthening the technology base and improve human resources for the development of profitable and competitive forest crops; and finally 4) investment promotion - to promote public and private efforts within the forest sector, creating forest project portfolios to encourage new investments, as well as promoting market intelligence studies for the most competitive and highest value added products for export and

establishing and identifying markets for new competitive forest products.

The national government, with the support of the Congress of the Republic, has four basic elements to support actions in the housing sector. These are: institutional restructuring; continuity of policies and compliance of commitments undertaken by previous governments; new sectoral policy instruments and adjustments to existing instruments to adapt them to a new environment. Within this framework, ministerial portfolios have been developed, giving rise to the Ministry for the Environment, Housing and Land Development; INURBE (Urban Reform Institute) has been dismantled; the National Housing Fund has been established; tax benefits have been maintained, particularly a 4% rebate on VAT for the acquisition of building materials for social housing as well as a 0.3% tax exemption for transactions from accounts related to the purchase of housing, payment of subsidies, promulgation and regulation of the rental law, development and regulation of real estate funds and specialised building societies, guarantee to cover variations in the Real Value Unit (Unidad de Valor Real - UVR), and arrangements with banks to provide resources for social housing projects, among others. The building sector growth rate by late 2002 was nearly 30% as compared to the previous year; however, it decreased slightly by the end of 2003 and was showing signs of recovery for 2004. This sector's share in the national GDP is currently almost 4%. Furthermore, the National Statistics Department has reported social housing starts for 2004 totaling 5 750 000 square metres in seven major cities of the country. The performance of the building sector has been excellent in recent years and has led to a high demand for goods and services from natural and planted forests.

The Bank of the Republic assesses the value of foreign investment in Colombia for each area of the economy based on the country's national accounting system. The forest sector is included in the area of Agriculture, Forestry, Fisheries and Hunting, which received a total investment of US\$7 billion, a positive trend compared to the previous year when negative investment values of US\$5 billion were reported.

One of the concerns of the Colombian government is increasing foreign investment in the forest sector to improve its productivity at the national level and ensure greater competitiveness

in both domestic and foreign markets. Thus, the government, through the National Forest Development Plan for 25 years and the General Forest Law (under review in the second legislative period of 2004), is seeking to offer legislative stability to foreign investors. This legislation specifies the responsibilities of the various land and environmental agencies for the management of resources as well as other significant provisions for foreign investors. The Ministry is now leading the legislative process for the promulgation of the General Forest Law and, as this law is being processed, specific actions have been taken in areas such as criteria and indicators for forest sustainability, transport safe-conducts, forest harvesting rates, sanctioning regime, assessment of fines, and development of guidelines for the formulation of management plans for threatened timber species, among others.

According to FINAGRO (Agricultural Sector Financing Fund) data, the area of commercial plantations established in 2003 under the Forest Incentive Certificate scheme can be broken down by region as follows: Magdalena Medio Bajo - 1 810 ha with oak (*Quercus humboldti*), gmelina, teak (*Tectona grandis*) and eucalyptus (*Eucalyptus* spp.); Cordoba - 1 865 ha, divided into oak (*Quercus humboldti*), acacia maglio, ceiba (*Ceiba pentandra*) and teak (*Tectona grandis*) plantations; Antioquia - 2 556 ha including pine (*Pinus* spp.), oak (*Quercus humboldti*), cedar (*Cedrela odorata*) and aliso (*Alnus jorullensis*); Caldas - 776 ha with aliso (*Alnus jorullensis*), walnut (*Cordia alliodora*), pine (*Pinus* spp.) and teak (*Tectona grandis*); and Santander - 130 ha divided into pine (*Pinus* spp.), aliso (*Alnus jorullensis*) and frijolito (*Shizolobium* sp.) Plantation establishment in 2003 covered a total area of 7 137 ha, which represents a decrease from the figure reported for 2002, when a total area of 9 975 ha was planted as follows: Magdalena Medio Bajo - 1 658 ha; Cordoba - 3 278 ha; Antioquia - 3 935 ha; and Caldas - 884 ha.

#### **Ecuador (2004)**

The Ecuadorian government granted permission to PetroBras, the Brazilian national oil company, to construct a 54 km road into the undisturbed section of the Ecuadorian Yasuní National Park in 2004. Environmental and human rights groups sued the government but were denied the right to pursue the case by the Ecuadorian Constitutional Court. An appeal has been lodged.

#### **Guatemala**

Current tariffs rates are as follows:

Logs Tropical: 0%

Logs Non-tropical: 0%

Sawn Tropical: 5%

Sawn Non-tropical: 5%

Veneer Tropical: 10%

Veneer Non-tropical: 10%

Plywood Tropical: 10%

Plywood Non-tropical: 10%

One of the major incentive-providing initiatives is the Forest Incentives Programme, through which the government offers a cash payment for the implementation of reforestation and forest management projects on suitable land.

A disincentive for future production is the industry's insufficient installed capacity to process small diameter timber and lesser-known broadleaved species. The lack of knowledge of adequate technologies and potential markets for secondary broadleaved species is evident. After the signing of the Free Trade Agreement with the US (CAFTA), the sector could be adversely affected by its limited competitiveness, which could in turn lead to an increase in forest products imports and thus have a negative impact on the balance of trade. Producers have limited capacity to meet market requirements, which is associated with the lack of access to information and limitations in the aggregation and management of supply.

There is a National Forestry Agenda for 2003-2012, which includes a number of actions, institutional arrangements, studies, programs and projects grouped by areas such as forest conservation and protection, sustainable management and production, trade and industry, environmental services and institutional strengthening. Within this framework, projects are being implemented in various areas such as genetic improvement of tropical species, market promotion of Guatemalan certified timber and timber products, and strengthening of the forest information system, among others. The Strategic Plan for 1998-2015 has also been established; it includes aspects related to the promotion of forest management, industrialisation and production, among others.

Efforts are currently being made to develop markets for secondary species, as traditional species (cedar and mahogany) have become scarce due to excessive harvesting in the past. New alternatives should be sought for abundant

lesser-known species in the international market. Therefore, the national industry is now trying to specialise in the identification of new species that may be introduced into the market. Forest concessions can provide a substantial supply to meet the demand for tropical timber in the national market and penetrate the international market. Some of these forest concessions have already been certified.

There is now an upward trend in construction costs in Guatemala due to higher prices of materials. This has led to an increase in the demand for prefabricated wooden houses made of impregnated timber, which is mostly met with timber imported from Canada and to a lesser extent with domestic timber. This seems to indicate that there will be an opportunity for domestic plantation timber (mostly coniferous) to satisfy the demand for raw materials in this sector.

Foreign involvement in the forest sector has mainly been in the form of financial support provided to cooperatives, communities, associations and organised groups through development projects by international cooperation agencies (GTZ, AID, FINNIDA, Holland, etc.), which have injected seed capital to start operations with a view to achieving self-management within a pre-established period of time.

Technical and regulatory documents have been developed to regulate and standardise criteria for the use, management and conservation of forest resources. These include *inter alia* the forest products transport regulations, the Tax Incentives Program Regulations, the Forest Stewardship System Regulations and the National Forest Registry Regulations.

The area of forest plantations in 2005 was 91,580 ha and the annual establishment rate averages about 11 000 ha/year.

### **Guyana**

Export restrictions on two species in log form are still in force. Guyana is promoting 6 lesser-used species under a programme started in 2003. However, acceptance of these species by international markets has been slow.

### **Honduras**

While no tariffs are applied to roundwood imports, there are some phyto-sanitary

requirements. Processed timber products are subject to various import tariffs, including a 15% rate on all species, plus a 12% value-added tax (VAT); the administrative rate of 0.5% has recently been eliminated.

The elimination of the 0.5% administrative rate has served as a tariff-related incentive for imports. For invoice values of US\$3 000.00 or more, no tariffs are applied to imports or exports. The only restriction is phyto-sanitary control. Section 44, Chapter IX, of the Central American Import Tariff Schedule governs import tariffs.

The Draft Forestry Law has not yet been approved as it is still being reviewed by the National Congress. The Free Trade Agreement (FTA) between Central America, the Dominican Republic and the USA is providing new opportunities for the forest industry.

Non-traditional species continue to be harvested and marketed with good acceptance in the national and international markets.

Natural disasters in the USA and the Caribbean have led to irregular disturbances in the market, with an increased demand for forest products such as sawnwood for the construction of housing in the national reconstruction processes.

Pine sawnwood is still a major component of the construction industry; its price has remained relatively stable over the last few years. However, prices of other industry inputs such as cement, reinforcing steel rods, etc. have increased. Synthetic materials are being introduced into the country in substantial quantities. The use of plasterboard for wall lining and the substitution of wood beams with metal girders are increasingly common.

Forest products transport controls continue to be carried out in cooperation with the National Police; however, illegal logging is still taking place.

A total of 802.0 ha of certified plantations have been established this year by public and private institutions, bringing the total plantation area to approximately 32 000 ha. These plantations are not under adequate management and therefore roundwood harvesting in these areas is very limited, except in private plantations, such as teak plantations, where low volumes of timber are being extracted.

## **Mexico**

Current tariffs rates are as follows:

Logs Tropical: 10%

Logs Non-tropical: 10%

Sawn Tropical: 15%

Sawn Non-tropical: 10%

Veneer Tropical: 15%

Veneer Non-tropical: 15%

Plywood Tropical: 15% or 20%

Plywood Non-tropical: 15% or 20%

The above tariff rates are MFN (most favoured nation) rates and they do not take into account tariff exception deadlines currently in force in countries that have signed a Free Trade Agreement (FTA) with Mexico.

It is estimated that tropical timber production for both native and introduced species will significantly increase over the next 10–15 years due to the current commercial forest plantation promotion policy implemented through the provision of direct economic incentives.

There is an economic incentives program to promote commercial forest plantations which is mainly geared to the use of (native and introduced) tropical species. Furthermore, there is a forest development program, which provides economic incentives to forest producers wishing to embark on further timber processing (i.e. value-added processing of products).

Expected trends show that the proportion of tropical timber species in the composition of trade will increase in the medium- to long-term (10 to 20 years). The share of tropical timber species is currently 5% as compared to non-tropical coniferous species which dominate the market with a 95% share. The proportion of tropical species should increase to 45% in 20 years thanks to the economic incentives program for plantations. With regard to lesser-used tropical species and secondary products, it is expected that their use should significantly increase by 20% through the forest development program currently under implementation.

The national demand for tropical timber has always been high as reflected in the prices attracted by these species in the domestic market; for example, the price of a cubic meter of red cedar or mahogany is six times higher than that of a cubic meter of pine. Furthermore, tropical timber species are much more sought after for decorative uses than coniferous timber species, and the demand for tropical timber in these applications is increasing. Annual growth rate in

tropical timber consumption in Mexico is estimated at 4%.

Given Mexico's land tenure structure, foreign involvement is very limited but tends to be higher in forest plantations, where foreign investments are currently estimated to account for 3% of total investments.

Over the last few years, tropical forest controls to prevent illegal logging have significantly increased through the Federal Bureau for Environmental Protection (PROFEPA – Procuraduría Federal de Protección del Ambiente), which is the agency in charge of enforcing the General Sustainable Forest Development Law promulgated in 2003. It is estimated that the imposition of penalties and fines has increased by 50% over the last three years.

The area of forest plantations is currently estimated at 100 000 ha, 70 000 ha of which include coniferous and non-coniferous tropical species. The annual plantation establishment rate in 2004 was 16 000 ha, and it is expected to increase to 20 000 ha in 2005. The proportion of plantation roundwood production (200 000 m<sup>3</sup>) was 3% of Mexico's total roundwood production in 2004 and is expected to increase to 4% (250 000 m<sup>3</sup>) in 2005. The objective is to increase it to 300% (18 million m<sup>3</sup>) of the roundwood volume harvested from natural forests (6 million m<sup>3</sup>) by the year 2030.

## **Panama**

Decree No. 57 was promulgated on 6 June 2002. It imposes a total ban on the export of logs, blocks, sawnwood or rough-planed timber from natural forests. This means that all exports of these products are from plantation timber.

The national forest policy was promulgated through Decree No. 2 of 17 January 2003. This policy promotes the export of finished products (i.e. higher value added products) and establishes the need for sustainable forest management. The Forestry Law and its Regulations are currently under revision. WWF-Central America is promoting sustainable forest management in indigenous territories.

There are currently 57 182 ha of forest plantations in Panama. The annual plantation establishment rate has decreased in comparison to previous years and is currently 2 000 ha.

**Peru (2004)**

Import tariffs for tropical timber products remain at 15% of the FOB value. There are no export quotas or restrictions for forest species, except for banned species. At present, there are several incentives in place, such as the Amazonian Law, which stipulates tax exemptions for fuel and payment of income tax and general sales tax (GST). In the case of exports, there is also a drawback facility involving tax rebates of up to 5% of the FOB value. In addition, lower harvesting fees are applied to those concessions that implement integrated projects for timber extraction, timber processing in mills located in the same region as the concession, and marketing of value-added forest products. Furthermore, voluntary forest certification for forest products from managed forests is also promoted.

The new forest legislation promotes the development of the forest industry throughout the national territory to ensure increased economic returns and social benefits for the communities related to forest activities. Furthermore, this legislation promotes the harvesting of a larger number of species to ensure optimal utilisation and forest logging, industrialisation and marketing chain integration. Unlike the previous legislation, whereby forest fees were based on extracted timber volumes, the current forest concession process involves the establishment of fees based on harvested areas. This new system encourages increased utilisation of timber volumes, including lesser-used species.

The domestic market is focusing on a larger number of species; thus, over 300 species are known, and about 30 of these are being marketed at the domestic level. The trade in these species is important for the forest sector because an increase in forest productivity is expected as a result of new harvesting modalities in concessions granted through public tender in the Departments of Madre de Dios, Ucayali, San Martín and Huanuco and Loreto, covering an area of more than 3.9 million hectares. The export market attracts high-value species such as mahogany and cedar. The former was listed in Appendix II of CITES as of 15 November 2003. An increase in other hardwood exports is expected, including species such as shihuahuaco, quinilla, estoraque, etc., which are geared to the Chinese market. Cumala exports are also significant for Peru.

The building sector is the highest timber demand sector in the country; however, the use of timber

is limited to formwork and, to a lesser extent, fine carpentry applications (finishes). There is an urgent need to develop the domestic market and boost the demand for wood-based housing construction components made of timber from tropical forests and reforested Andean watershed areas. These products can be used to process new materials for the construction of urban and rural housing at various socio-economic levels. This would have a positive effect in the national timber industry and would consequently generate employment in the sector. The limited use of timber and timber products for the construction of housing is a key problem for the sector. Its causes include: no history of timber use in housing construction; isolated development of technological and architectural research; a lack of organisation in the sector, from the logging to the dissemination stage; and the lack of a promotional body to promote the use and consumption of timber in the building industry. The effects can be summarised as follows: a lack of promotion of production systems geared to consumers; shortage of supply of dimension, treated and seasoned timber; no history of purchase/sale of standardised quality products; a lack of application and/or knowledge of existing technical standards; a lack of knowledge on new alternative species to replace traditional species; search for and substitution with new elements to replace timber products in the building industry; a lack of awareness of existing techniques for the grading of timber based on use criteria and wood properties; a lack of interest in the private sector regarding the processing of timber products for the building industry; and a lack of supply of prefabricated parts and components, among others.

Current mortgage facilities and interest rates do not favour the construction of timber housing. However, a housing program has been established promoting the use of natural forest species in fine carpentry applications (finishes). Furthermore, the existence of substitutes has limited the use of timber.

The interest of foreign investors is reflected in the recent forest concession process that has taken place in Permanent Production Forests. Within the framework of the current legislation, Permanent Production Forests have been established in the departments of Ayacucho, Cusco, Huanuco, Junín, Loreto, Madre de Dios, Pasco, Puno, San Martín and Ucayali. Public tender processes (granting of forest concessions)

have taken place in Madre de Dios, Ucayali, San Martin, Huanuco and Loreto.

The Forestry and Wildlife Commission (Intendencia Forestal y de Fauna Silvestre) is responsible for monitoring policies, plans, programmes and projects on sustainable use and conservation of forest resources. Almost 3000 m<sup>3</sup> of timber was seized by this body due to various infractions in the second half of 2003.

Most registered plantations in Peru are part of reforestation programmes with species such as eucalyptus, pine and other native species from the highlands region. A total of 754 244 ha has so far been reforested. Industrial roundwood from plantations accounts for 5–10% of national production. This figure will remain at less than 10%, due to the fact that many plantations are harvested for production purposes and are not subsequently reforested. There are also plantations that are used for protection rather than production purposes (e.g. in watershed areas). Plantation timber from the Coastal Region is mainly used for hedges (casuarina, eucalyptus), or very limited volumes are sold to mining companies.

### ***Suriname***

The Act on timber export taxes of November 1946 was revised in March 2005. With this revision logs and semi-processed timber can be exported within CARICOM duty free. On logs exported outside CARICOM there is a tax that varies between 18% and 20% of the export price and on semi-processed timber a tax that varies between 5% and 15% of the export price.

In 1996, a process was initiated to strengthen the institutional capacity of the forest sector to manage the forest resources of Suriname. The process was intended to replace the Suriname Forest Service (LBB) that had become obsolete after decades of successful functioning since its establishment in 1947. This process was supported with the technical assistance from the Food and Agriculture Organization of the United Nations (FAO), and with the financial assistance from the Dutch Government. This resulted in the establishment of the Foundation for Forest management and Production Control (SBB) as a step towards the establishment of the desired Forest Management Authority (now called BOSNAS). It is envisaged that the BOSNAS will be established by the end of 2005. The most important Act for Sustainable Forest Management

is the Forest Management Act of 1992, which is enforced by the SBB and, when established, by BOSNAS.

### ***Trinidad and Tobago***

Current import tariffs are as follows:

Logs Tropical: Free  
 Logs Non-Tropical: Free  
 Sawnwood Tropical: Free  
 Sawnwood Non-Tropical: Free  
 Veneer Tropical: 15%  
 Veneer Non-Tropical: Free  
 Plywood Tropical: 10%  
 Plywood Non-Tropical: 10%

There is a government programme which provides incentives for private land owners who are establishing and practicing forestry. Also, a National Reforestation Programme is currently ongoing. Teak and pine plantations have been allocated for sale to all sawmillers.

There is a demand for the lesser-known species however the demand for minor tropical forest products has fallen. There is an increased use of concrete, steel and aluminium roofs in the construction industry, instead of wood.

During 2002 100 forest offences were discovered: the lost royalty involved totalled TT\$70 277. Fines imposed and recovered totalled TT\$44 400.

Plantation establishment in 2004 was as follows:

Teak - 6 ha  
 Pine - 48 ha  
 Mixed spp. - 111 ha  
 Approximately 200 ha of plantations are established per year.

### ***Venezuela***

Incentives for SFM and forest development include income tax exemptions for all primary activities, the identification of new sites for forest management within areas designated for forest production throughout the country and a public forest financing fund for forest plantations and industrialization.

The private sector, through the company "Terranova de Venezuela", has recently established an industrial estate with state-of-the-art technology. It comprises an industrial sawmill, an MDF plant and a particleboard plant. The establishment of a pulp and paper plant is also planned with financing from the private and public sectors.

There is an average diversity of 458 forest species in natural forests, comprising 106 commercial species and 352 potential species. A total of 92 forest species from natural forests are currently being harvested. The results of studies being carried out on physical-mechanical properties of potential species will facilitate the introduction of new species into the market and production diversification.

Given the significance of secondary forest products, two (2) projects are currently being implemented within the Cuba-Venezuela cooperation agreement with a view to assessing the current status and potential of non-timber forest products in the states of Delta Amacuro and Amazonas.

In 2004, interest rates in the building sector, established through the Housing Policy Act, were about 10.83% per annum. The demand for family units (housing) in the country is about 2,000,000 units. The Government's Social Development Policy has promoted the construction of social housing through the Single Social Fund (Fondo Único Social), the National Housing Council (Consejo Nacional de la Vivienda - CONAVI), and the National Institute for Housing (Instituto Nacional de la Vivienda - INAVI), which will require timber products for construction and decoration purposes.

There are no restrictions in the current policy for foreign investment in forest activities in the country. Foreign involvement has been particularly significant in activities related to forest management plans, forest plantations, the sawmilling, pulp, paper and cardboard industries, and high and medium density fibreboard industries. Direct investments by the private sector in support of forest-related programmes, plans and projects have not been quantified.

Forest management companies implement forest management plans within the framework of administrative contracts concluded with the government, with financial resources committed by commercial banks involved in timber trade.

The area of forest plantations in the country is estimated at 800 591 ha, including coniferous and non-coniferous species. The average plantation establishment rate by the public and private forest sector ranges from 1 500 ha/year to 3 800 ha/year.

## **Consumer Countries**

### ***Egypt (2004)***

Customs tariff for sawnwood imports (HS code 4407) is 5%. The Government defers additional sales taxes (usually 5%) to encourage the private sector to increase their efforts in wood utilization. There is also a 3% customs service fee. Tariff rates on raw wood have been reduced to encourage the domestic industries.

No tropical or temperate natural forests are available in Egypt. Most of the local timber is obtained through either linear plantations or man-made forests. Presently, small areas of tropical timber plantations (*Khaya senegalensis* and *Terminalia arjuna*) are being established in the southern parts of Egypt.

The timber industry has increased the usage of softwood timber and hardwood timber for furniture production. Domestic buildings commonly use concrete, however, with tropical hardwood mostly used in railroad ties, veneers and furniture manufacture. Timber imports include mainly softwood timber, temperate hardwood timber, panel products, railroad ties, sleepers, veneer wood, plywood and particleboard.

Egypt mainly imports tropical hardwood timber from West Africa (Cameroon, Côte d'Ivoire, Gabon and Republic of Congo), Malaysia, Indonesia and recently China. Coniferous timber is mostly imported from Finland, Sweden, Russia, Romania, Slovenia, France, the USA and Canada.

### ***European Union***

#### ***Denmark (2004)***

No initiatives affect Danish production and trade of tropical timber products. There is nothing that indicates any trend for expanding capacity etc. In the past few years, there is a growing interest in wooden houses.

#### ***France (2004)***

Applied tariff rates are common to the European Union. Other than current European rules, no national rules are applied to tropical timber imports. However, a new provision was adopted by the French Government in 2003-04 specifying that tropical timber used in government contracts should be certified and originate from forests under sustainable management. No significant plans exist to increase tropical timber processing capacity or the range of utilized species.

The number of building permits increased by 12.1% in 2004 compared to the first half of 2003, in particular for housing in apartment buildings. However, the number of permits for other non-housing buildings decreased by 3.3% compared to the first half of 2003.

### ***Japan***

In recent years, the plywood industry in Japan is shifting its use of materials from tropical timber to coniferous timber. Coniferous plywood production is steadily increasing, and approached 71% of total domestic plywood production in 2004.

The volume of imported plywood with at least one outer ply of 14 major tropical species (Dark Red Meranti, Light Red Meranti, White Lauan, Sipo, Limba, Okoume, Obeche, Acajou, Sapelli, Virola, Mahogany, or Palissandre de Para) has been declining since 1995.

The annual housing starts for 2004 increased by 2.5% to 1,189,049 units. The share of wooden-structure housing starts for 2004 was 45.5% which was up by 3.4% as compared to the previous year.

### ***New Zealand***

Current tariffs rates are as follows:

Logs Tropical: Free

Logs Non-Tropical: Free

Sawn Tropical: See Below

Sawn Non-Tropical: See Below

Veneer Tropical: See Below

Veneer Non-Tropical: See Below

Plywood Tropical: 5%-7%

Plywood Non-Tropical: 5%-7%

Preferential tariffs on plywood due to be phased out by 2010. All sawn non-tropical and tropical timber enters New Zealand duty free unless sanded or finger-jointed (tariff of up to 7.0%). Tropical veneer enters NZ duty free except for code 4408.10.09 (tariff up to 7.0%). Non-tropical veneer enters NZ duty free except if not "planed" (tariff 6.5%). All of these tariffs are due to be reduced to 5% - 5.5% by July 2008.

New Zealand remains a very small importer of tropical species.

Planted production forest area as at 1 April 2004: 1.8 million ha (89% radiate pine, 6% Douglas-fir). New planting in 2003: 19 900 ha; average over last 30 years: 44 000 ha/yr. Proportion of roundwood from planted production forests: 99.9%.

### ***Norway***

There are no tariffs on the import of wood products in Norway. No specific factors are expected to have a significant impact on the very limited trade of tropical timber products in Norway in the near future. There are no plans for expanding tropical timber processing capacity.

Lesser-used tropical timber species have limited importance. No significant changes in tropical timber consumption due to domestic factors are expected.

Forest plantations occupy approximately 300 000 ha. The establishment rate was approximately 150 ha in 2004. The proportion of industrial roundwood production from plantations is less than 2.5 percent.

## APPENDICES

The following Appendices contain data on production, trade and consumption by country (Appendix 1), major trade flows by product (Appendix 2), major species traded (Appendix 3), prices of major tropical timber products (Appendix 4), trade in secondary processed wood products (Appendix 5) and the 2005-2006 ECE/FAO Timber Committee market statement (Appendix 6).

In Appendix 1, unit values may differ for equivalent volumes/values due to rounding. In Appendix 2, figures reported by importers are shown in **bold** typeface while those corresponding to export reports are in *italics*. Only major trading relationships (the top twelve importers and exporters for each category) are presented in Appendix 2.

The sources indicated below are applicable to all tables. The notes are of relevance to one or more tables.

Sources: 2005 Joint Forest Sector Questionnaire. Other sources are indicated by the superscripts after the figures (C: UNSO COMTRADE or EUROSTAT COMEXT databases; E: UN-ECE Timber database, F: FAOSTAT database; G: Global Trade Atlas; I: ITTO estimate; <sup>+</sup>: Proportional estimate; \*: Other unofficial data including country statistical reports, trade journals, ITTO project reports, USDA Foreign Agricultural Service reports, etc. – see References for a list of all data sources used).

Notes: Domestic Consumption = Production + Imports - Exports  
 The superscript "A" indicates adjustment from veneer area to volume assuming an average veneer sheet thickness of 2 mm.  
 The superscript "D" indicates adjustment to calendar year figures from figures provided for portions of a calendar year or for a non-calendar fiscal year.  
 The superscript "R" indicates a figure rounded down to zero.  
 The superscript "W" indicates adjustment from weight (usually metric tons) to volume assuming the following factors (unless different conversion factors are reported): coniferous logs – 1.43m<sup>3</sup>/ton; non-coniferous tropical logs – 1.37m<sup>3</sup>/ton; non-coniferous non-tropical logs – 1.25m<sup>3</sup>/ton; coniferous sawnwood – 1.82m<sup>3</sup>/ton; non-coniferous sawnwood – 1.43m<sup>3</sup>/ton; veneer – 1.33m<sup>3</sup>/ton; plywood – 1.54m<sup>3</sup>/ton.  
 Dashes (--) in Tables indicate data not available or impossible to calculate (i.e. divide by zero).  
 Export values/prices in Appendices 1, 3, 4 and 5 are FOB; import values are CIF, unless otherwise stated.

The following ITTO members did not respond to the 2005 Joint Forest Sector Questionnaire: Brazil, Central African Republic, Democratic Republic of Congo, Fiji, Liberia, Nigeria, Papua New Guinea and Vanuatu.

## Appendix 1

### Production and Trade of Timber, 2001-2005

<<An asterisk (\*') next to a country name (or year) means that country did not provide new data in 2005 for that product/year and that data previously presented in the 2004 *Review* is being repeated.>>

## Explanatory Note

This note provides details of species included under various sub-headings of Chapter 44 of the Harmonized System (HS) of customs classification. It is not a comprehensive list of HS codes, but it provides a key for those countries in Appendix 3 that reported species trade according to such codes (Brazil, Finland, France, New Zealand, Norway and Portugal). Note that extensions of the HS beyond 6 digits are country or region specific and the same species may therefore appear under more than one code in the following list if different countries categorize it differently. Some countries have provided 10 or 8 digit HS codes with no explanation; please refer to the corresponding 8 or 6 digit code for these. For the purposes of the HS and in the descriptions that follow, "Tropical Wood" means one of the following species:

Abura, Acajou d'Afrique, Afromosia, Ako, Alan, Andiroba, Aningré, Avodiré, Azobé, Balau, Balsa, Bossé clair, Bossé foncé, Cativo, Cedro, Dabema, Dark Red Meranti, Dibétou, Doussié, Fremiré, Freijo, Fromager, Fuma, Geronggang, Ilomba, Imbuia, Ipé, Iroko, Jaboty, Jelutong, Jequitiba, Jongkong, Kapur, Kempas, Keruing, Kosipo, Kotibé, Koto, Light Red Meranti, Limba, Louro, Maçaranduba, Mahogany, Makoré, Mansonia, Mengkulang, Meranti Bakau, Merawan, Merbau, Merpauh, Mersawa, Moabi, Niangon, Nyatoh, Obeche, Okoumé, Onzabili, Orey, Ovengkol, Ozigo, Paduk, Paldao, Palissandre de Guatemala, Palissandre de Para, Palissandre de Rio, Palissandre de Rose, Pau Marfim, Pulai, Punah, Ramin, Sapelli, Saqui-Saqui, Sepetir, Sipo, Sucupira, Suren, Teak, Tiama, Tola, Virola, White Lauan, White Meranti, White Seraya, Yellow Meranti.

Note that species from tropical countries other than those listed above are still considered tropical timber by ITTO and, if correctly recorded by customs authorities, are included as "Others" in categories 4403.99, 4407.99, 4408.90 and 4412.99.

HS Code	Description
<b>4403.41-49</b>	<b>Tropical Wood in the rough, whether or not stripped of bark or sapwood, or roughly squared. (ITTO: Logs)</b>
<i>4403.41</i>	Dark Red Meranti, Light Red Meranti, and Meranti Bakau
<i>4403.49</i>	Other Tropical Wood
4403.49.00.03	Keruing, Ramin, Kapur, Teak, Jongkong, Merbau, Jelutong and Kempas
4403.49.00.09	Not elsewhere specified in 4403.41 or 4403.49
4403.49.10	Sapelli, Acajou d'Afrique and Iroko
4403.49.20	Okoumé
4403.49.30	Obéché
4403.49.40	Sipo
4403.49.50	Limba
4403.49.60	Tiama, Mansonia, Ilomba, Dibétou and Azobé
4403.49.70	Virola, Mahogany ( <i>Swietenia</i> spp.), Imbuia, Balsa, Palissandre de Rio, Palissandre de Para and Palissandre de Rose
4403.49.90	Other Tropical Wood
<i>4403.99</i>	Other non-coniferous
<b>4407.24-29</b>	<b>Tropical Wood sawn or chipped lengthwise, sliced or peeled, whether or not planed, sanded or finger-jointed, of a thickness exceeding 6 mm. (ITTO: Sawnwood)</b>
<i>4407.24</i>	Virola, Mahogany ( <i>Swietenia</i> spp.), Imbuia and Balsa
4407.24.00.10	Virola (Baboén)
4407.24.00.20	Mahogany, Philippine (Lauan)
4407.24.00.30	Mahogany, American ( <i>Swietenia</i> spp.)
4407.24.00.40	Balsa
4407.24.00.90	Other
4407.24.10	Finger-jointed, whether or not planed or sanded
4407.24.90	Other
<i>4407.25</i>	Dark Red Meranti, Light Red Meranti, and Meranti Bakau
4407.25.31	Planed: Blocks, strips and friezes for parquet or wood block flooring, not assembled
4407.25.39	Planed: Other
4407.25.50	Sanded

4407.25.60	Other: Dark red Meranti and Light Red Meranti
4407.25.80	Other: Meranti Bakau
4407.26	White Lauan, White Meranti, White Seraya, Yellow Meranti and Alan
4407.26.31	Planed: Blocks, strips and friezes for parquet or wood block flooring, not assembled
4407.26.39	Planed: Other
4407.26.50	Sanded
4407.26.70	Other: White Lauan and White Meranti
4407.26.80	Other: White Seraya, Yellow Meranti and Alan
4407.29	Other Tropical Wood
4407.29.00.10	Teak
4407.29.00.20	Other
4407.29.10	Finger-jointed, whether or not planed or sanded
4407.29.20	Planed: Palissandre de Rio, Palissandre de Para and Palissandre de Rose
4407.29.31	Other: Blocks, strips and friezes for parquet or wood block flooring, not assembled
4407.29.39	Other
4407.29.50	Sanded
4407.29.61	Other: Azobé
4407.29.69	Other: Other
4407.29.70	Other: Finger-jointed, whether or not planed or sanded
4407.29.90.01	Wood, tropical; Keruing, Ramin, Kapur, Teak, Jongkong, Merbau, Jelutong and Kempas, sawn or chipped lengthwise, sliced or peeled, (not planed or sanded or finger-jointed), thicker than 6 mm
4407.29.90.09	Wood, tropical; Not elsewhere specified in item no. 4407.29, sawn or chipped lengthwise, sliced or peeled, (not planed or sanded or finger-jointed), thicker than 6 mm
4407.29.99	Other Tropical Wood
4407.99	Other non-coniferous
<b>4408.31-90</b>	<b>Veneer sheets and sheets for plywood (whether or not spliced) and other tropical wood sawn lengthwise, sliced or finger-jointed, of a thickness not exceeding 6 mm. (ITTO: Veneer)</b>
4408.31	Dark Red Meranti, Light Red Meranti and Meranti Bakau
4408.31.11	Finger-jointed, whether or not planed or sanded
4408.31.21	Planed
4408.31.25	Sanded
4408.31.30	Other
4408.39	Other Tropical Wood
4408.39.00.10	Mahogany, Philippine (Lauan)
4408.39.00.20	Mahogany, African (Acajou d'Afrique)
4408.39.00.30	Mahogany, American ( <i>Swietenia</i> spp.)
4408.39.00.90	Other
4408.39.11-35	White Lauan, Sipo, Limba, Okoumé, Obeche, Acajou d'Afrique, Sapelli, Virola, Mahogany ( <i>Swietenia</i> spp.), Palissandre de Rio, Palissandre de Para and Palissandre de Rose:
4408.39.11	Finger-jointed, whether or not planed or sanded
4408.39.21	Planed
4408.39.25	Sanded
4408.39.31	Other: Of a thickness not exceeding 1 mm
4408.39.35	Other: Of a thickness exceeding 1 mm
4408.39.51-99	Other
4408.39.81	Other: Of a thickness not exceeding 1 mm: Makoré, iroko, tiama, mansonia, ilomba, dibétou, azobé, White Meranti, white seraya, Yeloo Meranti, alan, keruing, ramin, kapur, teak, jongkong, merbau, jelutong, kempas, imbuia and balsa
4408.39.89	Other
4408.39.90.09	White Lauan, Sipo, Limba, Okoumé, Obeche, Acajou d'Afrique, Sapelli, Mahogany ( <i>Swietenia</i> spp.), sheets for veneer or plywood, other wood sawn lengthwise, sliced or peeled, rotary, not planed, over 1 mm but not over 6 mm thick

4408.39.91	Of a thickness exceeding 1mm: Makoré, Iroko, Tiama, Mansonia, Ilomba, Dibétou, Azobé, White Meranti, White Seraya, Yellow Meranti, Alan, Keruing, Ramin, Kapur, Teak, Jongkong, Merbau, Jelutong, Kempas, Imbuia and Balsa
4408.39.99	Other
4408.90	Other non-coniferous
4408.90.08.41	Tropical hardwoods, not elsewhere specified in heading no. 4408, sheets for veneer or plywood, other wood sawn lengthwise, sliced or peeled, rotary, not planed, over 1 mm but not over 6 mm thick
<b>4412.13-99</b>	<b>Plywood, veneered panels and similar laminated wood. (ITTO: Plywood)</b>
4412.13	Plys all wood, each ≤ 6 mm, with at least one outer ply of tropical wood
4412.13.10	Whether or not painted, edge- or face-worked, but not otherwise worked or surface-covered
4412.13.10.01	Plywood; wood only, each ply 6 mm or thinner, at least 1 outer ply tropical, either Dark or Light Red Meranti, White Lauan, Sipo, Sapelli, Limba, Okoumé, Obeche, Mahogany ( <i>Swietenia</i> spp.) or Acajou d'Afrique, overlaid, including veneered
4412.13.10.09	Plywood; wood only, each ply 6 mm or thinner, at least 1 outer ply tropical, either Dark or Light Red Meranti, White Lauan, Sipo, Sapelli, Limba, Okoumé, Obeche, Mahogany ( <i>Swietenia</i> spp.) or Acajou d'Afrique, not overlaid, or veneered
4412.13.10.19	Doorskins of Mahogany, other than Philippine
4412.13.10.20	Teak
4412.13.10.30	Other, Philippine Mahogany (Lauan)
4412.13.10.80	Other, Mahogany
4412.13.10.90	Other
4412.13.11	Okoumé
4412.13.19	Dark Red Meranti, Light Red Meranti, White Lauan, Sipo, Limba, Obeche, Acajou d'Afrique, Sapelli, Virola, Mahogany ( <i>Swietenia</i> spp.), Palissandre de Rio, Palissandre de Para and Palissandre de Rose
4412.13.90	Other
4412.13.90.19	Doorskins of Mahogany, other than Philippine
4412.13.90.90	Other
4412.14	Plys all wood, each ≤ 6 mm with at least one outer ply of non-coniferous wood
4412.22	Plys not all wood and/or at least one ply > 6mm, with at least one outer ply of tropical wood
4412.22.10	Containing at least one layer of particle board
4412.22.10.00	Whether or not painted, edge- or face-worked, but not otherwise worked or surface-covered
4412.22.90.00	Other
4412.22.91	Blockboard, laminboard and battenboard
4412.23	Plys not all wood and/or at least one ply > 6 mm, at least one outer ply non-coniferous, at least one layer of particleboard
4412.92	Plys not all wood and/or at least one ply > 6 mm, both outer plies coniferous with at least one ply of tropical wood
4412.92.10.00	Whether or not painted, edge- or face-worked, but not otherwise worked or surface-covered
4412.92.90.00	Other
4412.92.99	Other
4412.99	Other

## Species Codes and Species Description for Indonesia

Species Code	Description
<b>Industrial Roundwood</b>	
440349100	White Meranti
440349600	Teak
440349700	Jelutong
440349900	Other kinds of tropical woods
440399100	Wood in the rough of other woods, for pulping
440399940	Wood in the rough of iron group
440399950	Other wood in the rough of Sandalwood, Laka
440399960	Other wood in the rough of Kuku, Perupuk, Sonokeling, Sonokembang
440399990	Wood in the rough of other woods
440341100	Dark Red Meranti, Light Red Meranti
440341200	Meranti Bakau
440349300	Keruing
440349400	Ramin
440399910	Wood in the rough of Pulai group
440399970	Other wood in the rough of Giam, Jeunjing/Sengon, Johar, Karet
440399980	Other wood in the rough of Cempakadurian Burung, Rengas, Sindur
440349500	Kapur
<b>Sawnwood</b>	
440724100	Sawn lengthwise but not planed, sanded of Virola, Mahogany
440724200	Sliced or peeled but not planed, sanded of Virola, Mahogany
440724300	Virola, Mahogany for parquet flooring
440724900	Other form of Virola, Mahogany
440725100	Sawn lengthwise but not planed, sanded of Dark Red Meranti
440725200	Sliced or peeled but not planed, sanded of Dark Red Meranti
440725300	Dark Red Meranti for parquet floor
440725900	Other form of Dark Red Meranti
440726110	Sawn lengthwise but not planed of White Meranti
440726120	Sawn lengthwise but not planed of Yellow Meranti
440726190	Sawn lengthwise but not planed of other White Lauan
440726210	Sliced or peeled but not planed of White Meranti
440726290	Sliced or peeled but not planed of other White Lauan
440726310	Parquet flooring of White Meranti
440726390	Parquet flooring of other White Lauan
440726910	Other forms of White Meranti, NES
440726990	Other forms of White Lauan, NES
440729110	Sawn lengthwise but not planed of Teak
440729120	Sawn lengthwise but not planed of Ramin
440729130	Sawn lengthwise but not planed of Jongkong, Jelutong, Kapur
440729190	Other sawn lengthwise but not plane tropical wood, NES
440729210	Sliced or peeled but not planed of Teak
440729230	Sliced or peeled but not planed of Jongkong, Jelutong, Kapur
440729290	Other sliced or peeled but not planed tropical wood, NES
440729310	Parquet flooring of Teak
440729320	Parquet flooring of Ramin
440729330	Parquet flooring of Jongkong, Jelutong, Kapur
440729390	Other parquet flooring of tropical wood, NES
440729910	Other forms of Teak
440729920	Other forms of Ramin
440729930	Other forms of Jongkong, Jelutong, Kapur
440729990	Other forms of tropical wood, NES

<b>Species Code</b>	<b>Description</b>
440799110	Sawn lengthwise but not planed of Ebony
440799120	Sawn lengthwise but not planed of Sandalwood
440799130	Sawn lengthwise but not planed of Kuku, Sungkai, Sonokembang
440799140	Sawn lengthwise but not planed of Giam, Jeunjing/Sengon
440799150	Sawn lengthwise but not planed of Balau, Bangkirai
440799190	Sawn lengthwise but not planed of other wood
440799210	Sliced or peeled but not planed of Ebony
440799220	Sliced or peeled but not planed of Kuku, Sungkai, Sonokembang
440799230	Sliced or peeled but not planed of Giam, Jeunjing/Sengon
440799240	Sliced or peeled but not planed of Balau, Bangkirai
440799290	Sliced or peeled but not planed of other wood
440799310	Other wood sawn, but not planed of Sandalwood
440799320	Other wood sawn, but not planed of Balau/Damar-Laut, Bangkirai
440799390	Other wood sawn, but not planed of other wood
440799911	Parquet flooring of Ebony
440799912	Parquet flooring of Sandalwood
440799913	Parquet flooring of Kuku, Sungkai, Sonokembang
440799914	Parquet flooring of Giam, Jeunjing/Sengon
440799915	Parquet flooring of Balau/Damar-Laut, Bangkirai
440799919	Parquet flooring of other wood for other purposes
440799991	Other wood sawn of Ebony for other purposes
440799993	Other wood sawn of Kuku, Sungkai, Sonokembang for other purposes
440799994	Other wood sawn of Giam, Jeunjing/Sengon for other purposes
440799995	Other wood sawn of Balau/Damar-Laut, Bangkirai for other purposes
440799999	Other wood sawn of other wood for other purposes
<b>Veneer</b>	
440831100	Veneer sheets of Dark Red Meranti in rotary shelled
440831900	Other veneer sheets of Dark Red Meranti
440839100	Other veneer sheets of tropical wood in rotary shelled
440839900	Other veneer sheets of tropical wood in other forms NES
440890100	Veneer sheets of other wood, peeled by rotaring
440890900	Other veneer sheets of other woods
<b>Plywood</b>	
441213000	Plywood with at least one outer ply of tropical wood with at least 6 mm thickness
441214000	Other plywood with at least 6 mm thickness, with at least one ply of non-coniferous
441222000	Other plywood with at least one ply tropical wood containing particle board
441223000	Other plywood with at least one ply of non-coniferous wood
441229000	Other plywood containing particle wood with at least 1 ply tropical wood

## Appendix 4

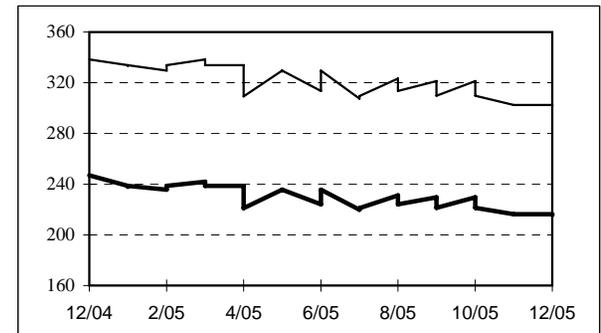

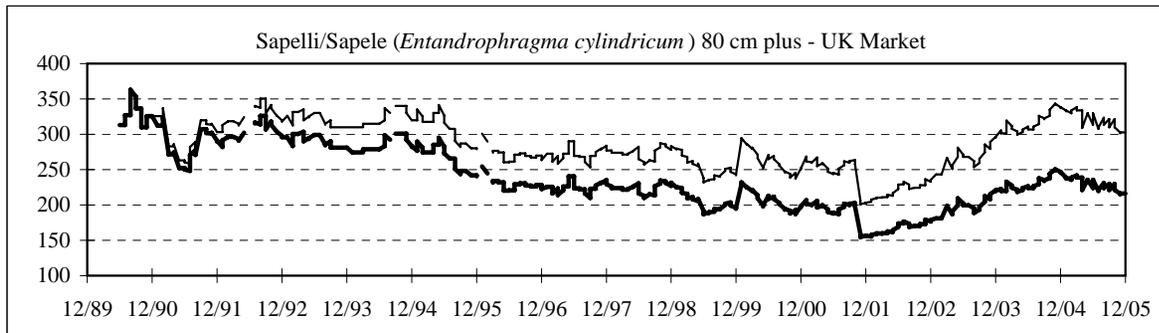

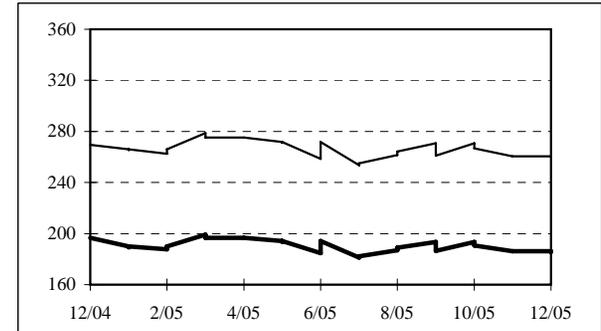

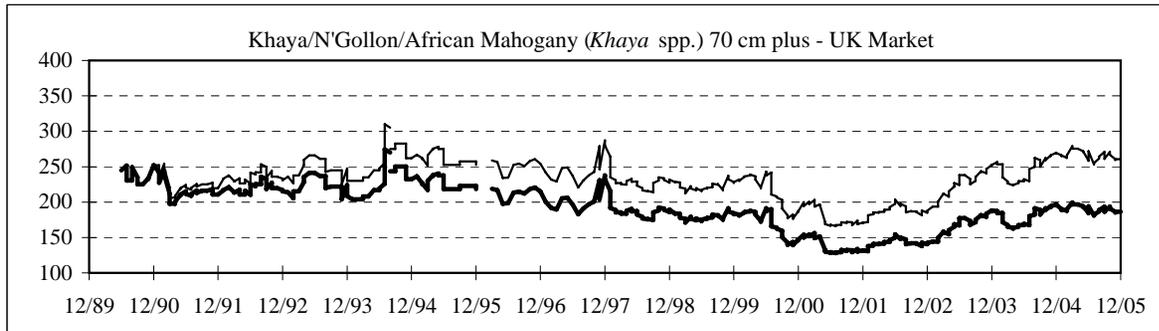

### Prices of Major Tropical Timber and Selected Competing Softwood Products

4-1. Logs .....	185
4-2. Sawnwood .....	189
4-3. Plywood .....	192
4-4. Secondary Processed Wood Products .....	196

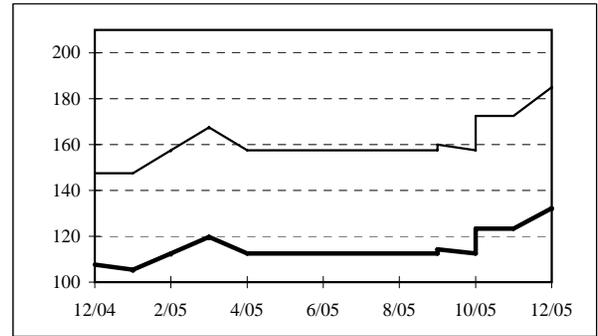

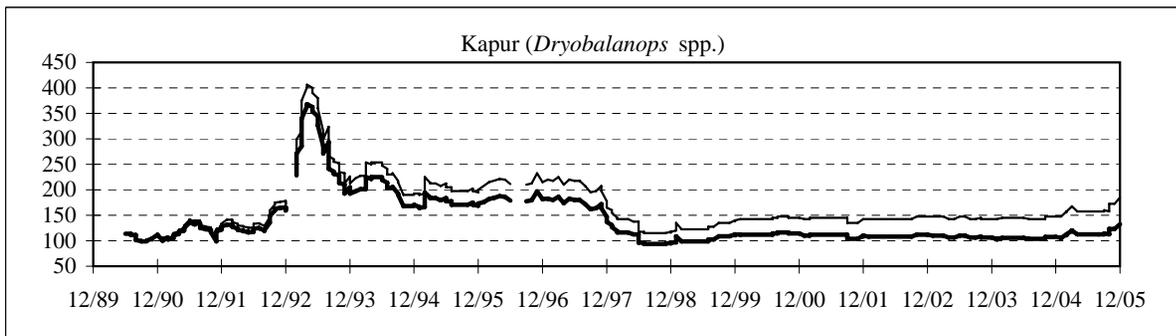

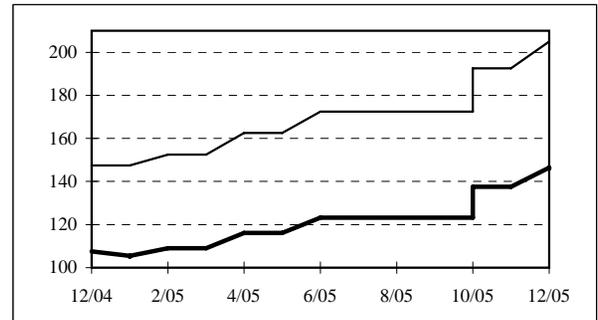

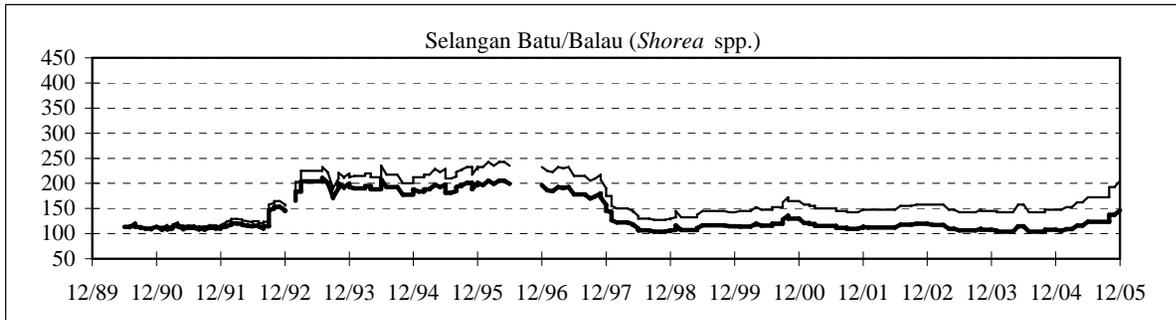

### 4-1-a. Price of Cameroon Logs, 1990-2005

Bold lines show FOB prices in constant 1990 US\$ per cubic meter (deflated by the IMF's Consumer Price Index for industrial countries). Normal lines show nominal FOB price trends. Graphs on this page show major log export species from Cameroon. Grades are Loyal et Marchand or equivalent.

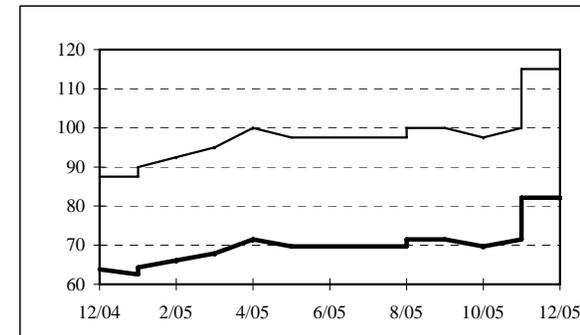

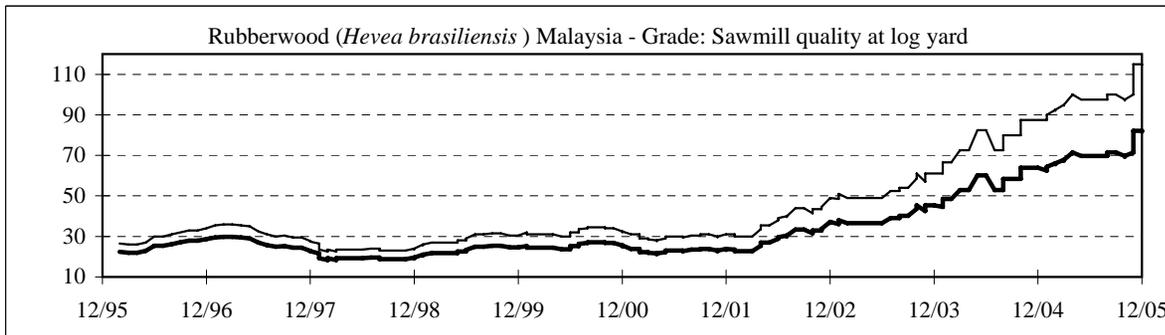

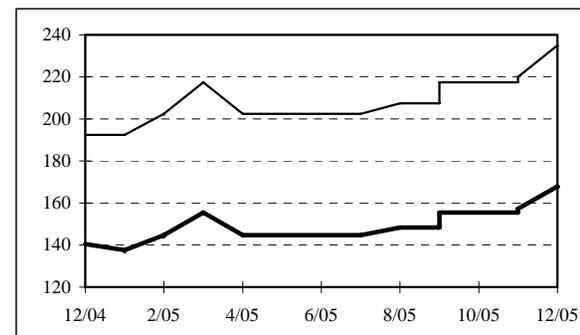

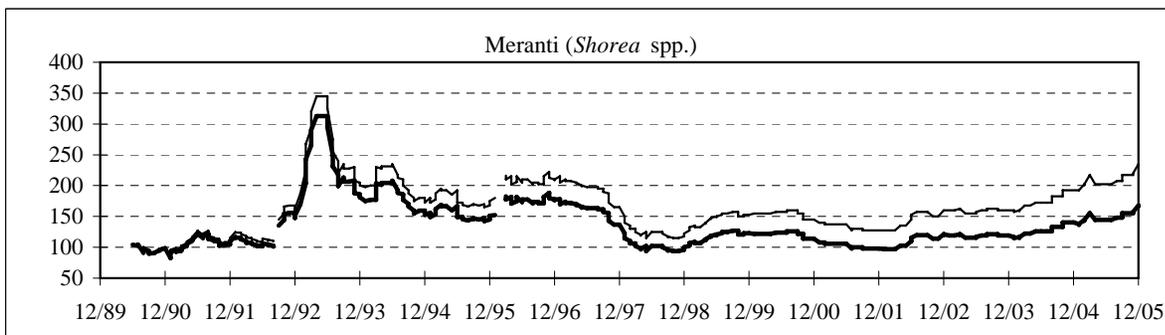

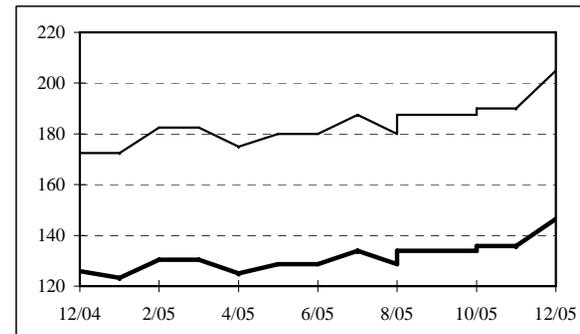

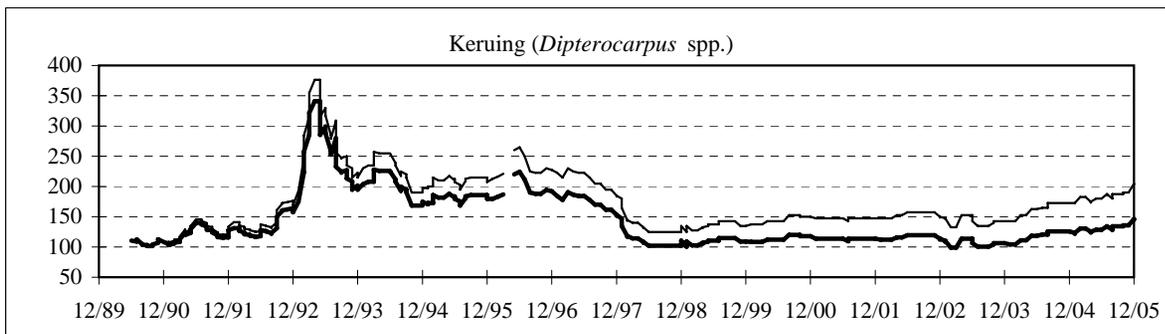

### 4-1-b. Price of Malaysian Logs, 1990-2005

Bold lines show FOB prices in constant 1990 US\$ per cubic meter (deflated by the IMF's Consumer Price Index for industrial countries). Normal lines show nominal FOB price trends. Graphs on this page show major log export species from Malaysia. Grades are Sawmill Quality and up.

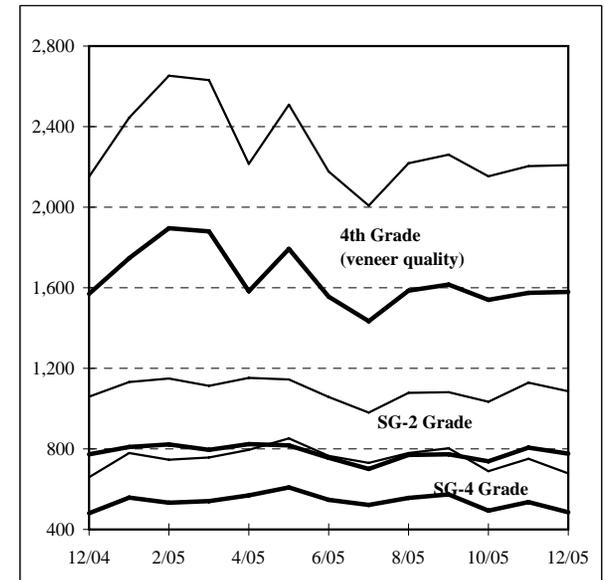

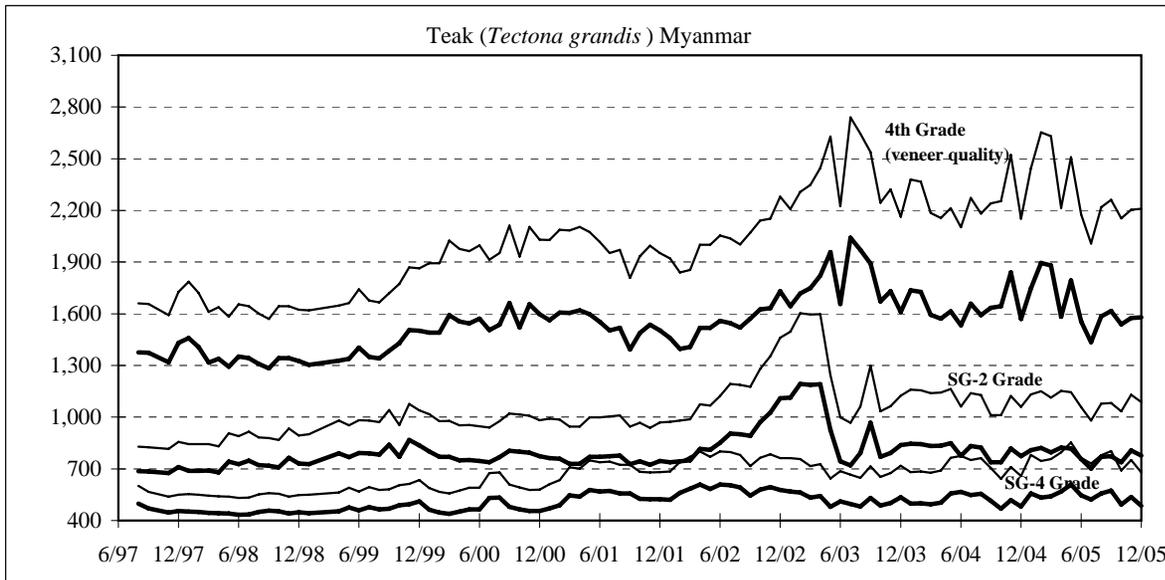

### 4-1-b. Price of Malaysian Logs (cont.), 1990-2005

Bold lines show FOB prices for Keruing and Meranti and domestic prices for Rubberwood in constant 1990 US\$ per cubic meter (deflated by the IMF's Consumer Price Index for industrial countries). Normal lines show nominal FOB price trends. Graphs on this page show major log export species from Malaysia. Grades are Sawmill Quality and up.

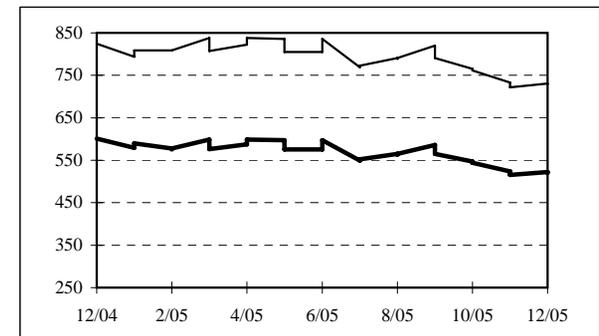

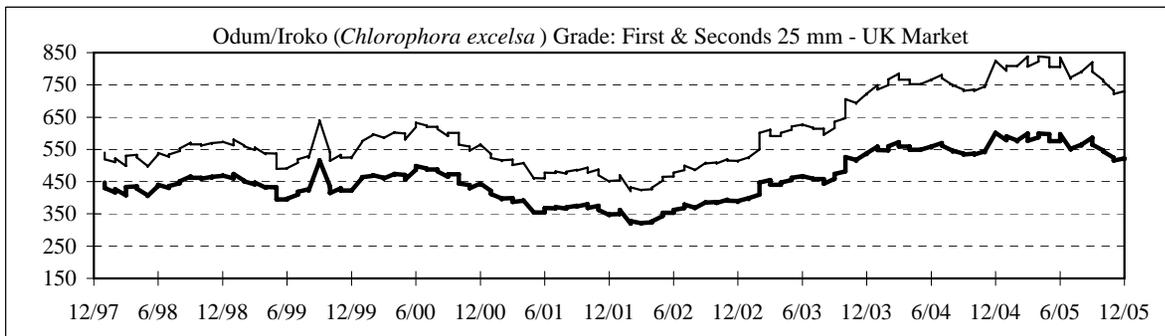

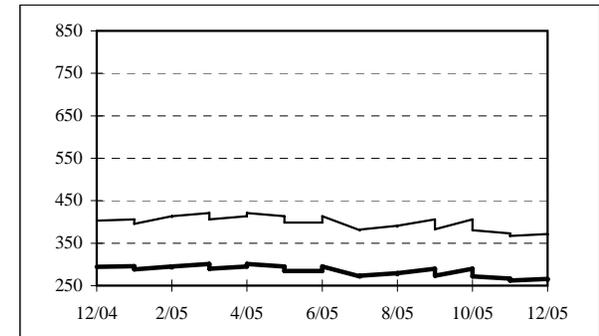

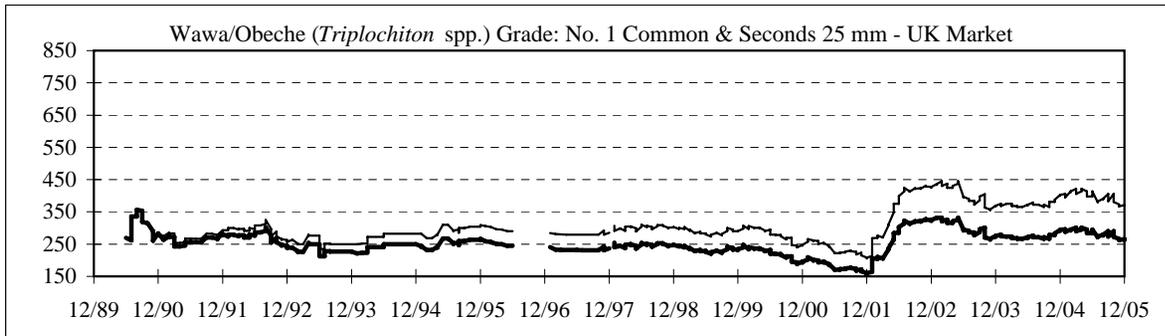

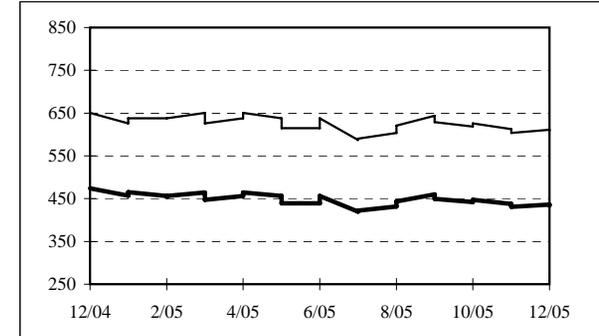

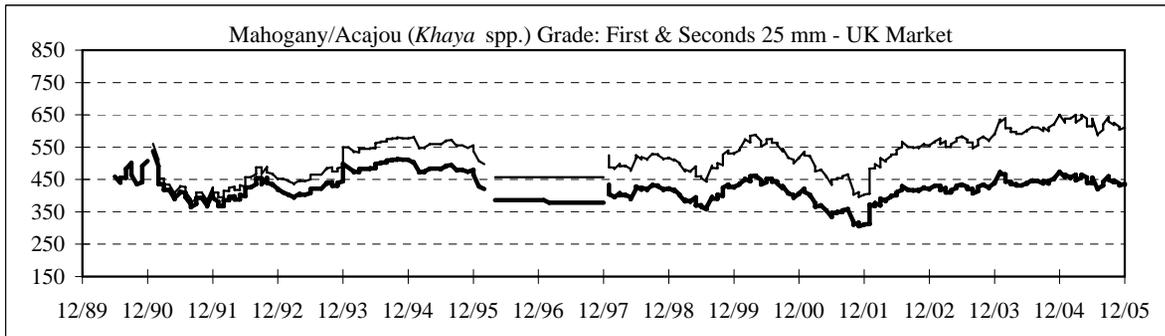

### 4-1-c. Price of Myanmar Teak Logs, 1997-2005

Bold lines show FOB prices for three Teak grades in constant 1990 US\$ per cubic meter (deflated by the IMF's Consumer Price Index for industrial countries). Normal lines show nominal FOB and domestic prices trends for these species, respectively.

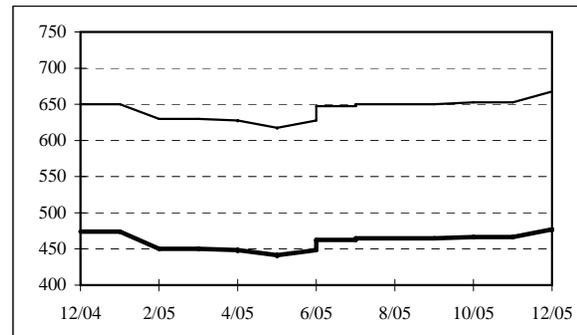

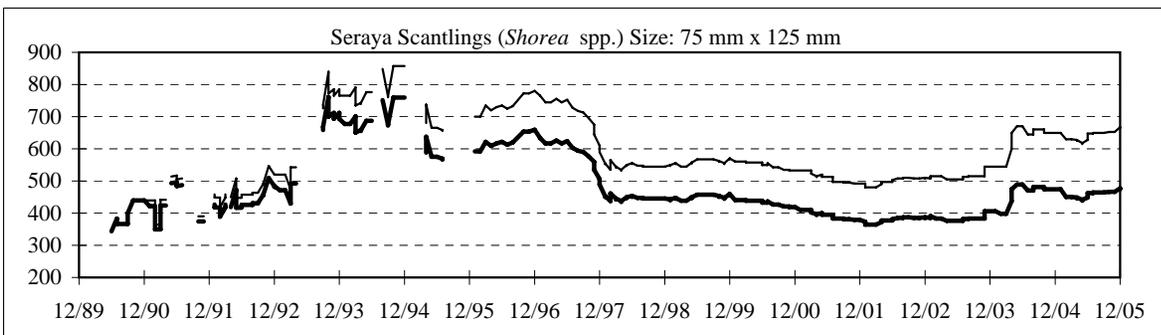

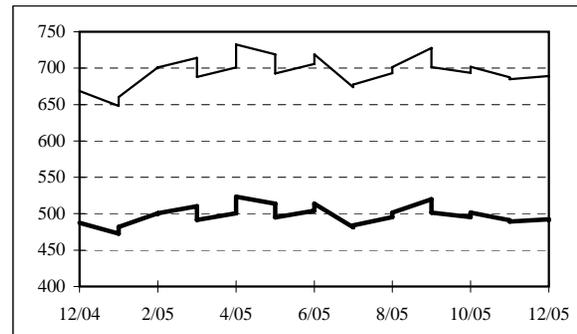

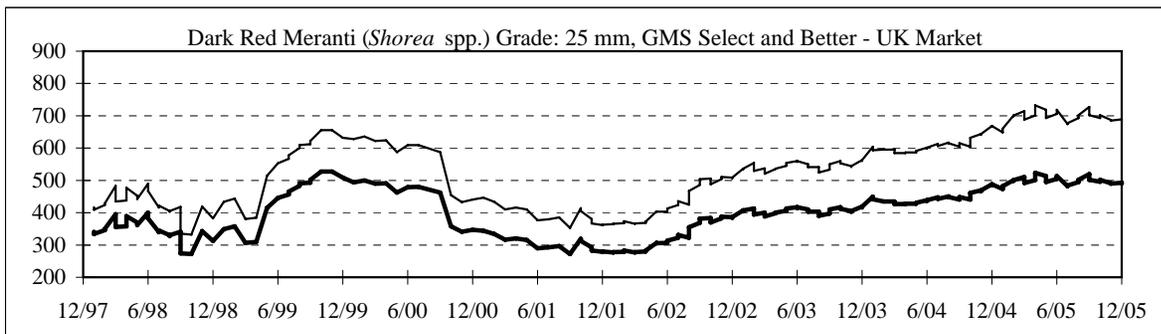

## 4-2-a. Price of Ghanaian Sawwood, 1990-2005

Bold lines show FOB prices in constant 1990 US\$ per cubic meter (deflated by the IMF's Consumer Price Index for industrial countries). Normal lines show nominal FOB price trends.

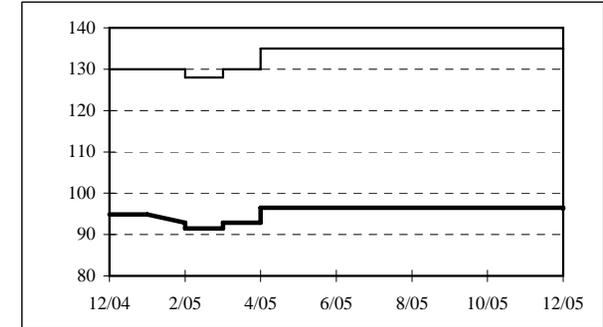

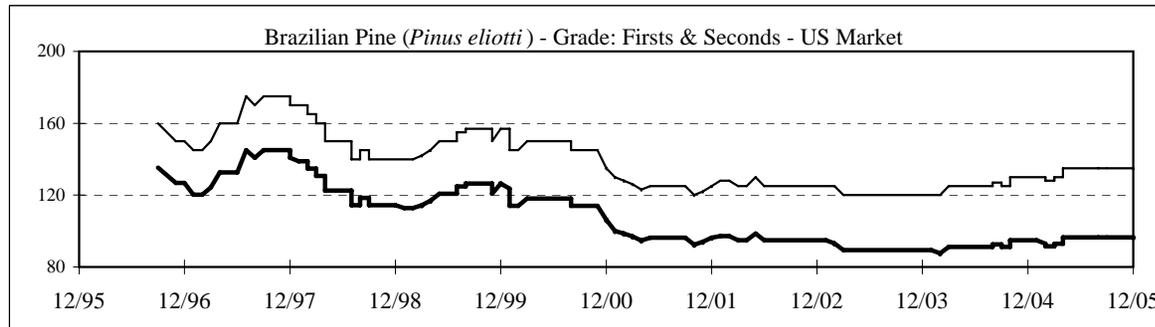

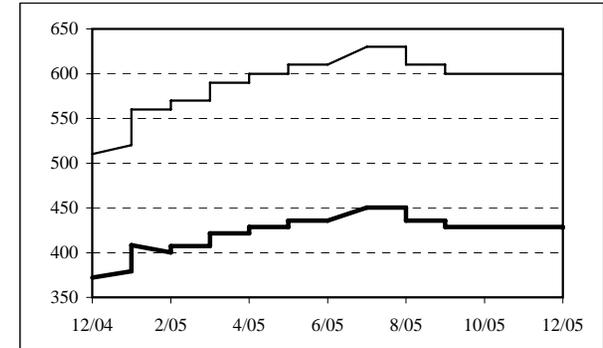

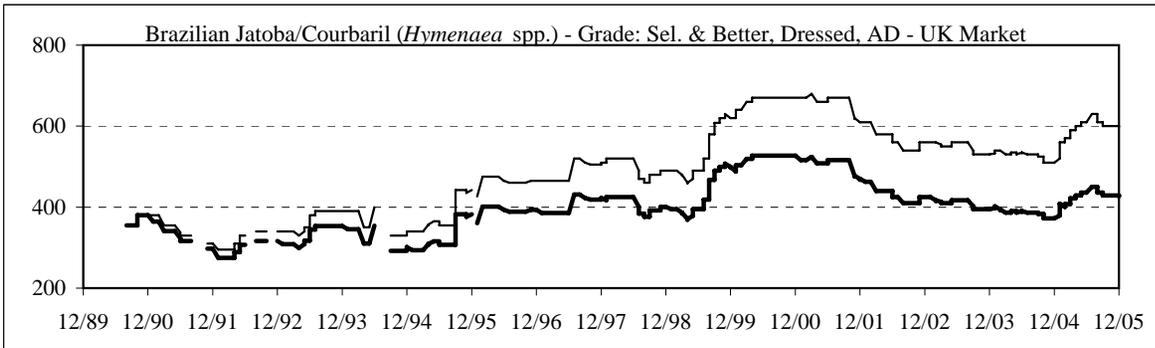

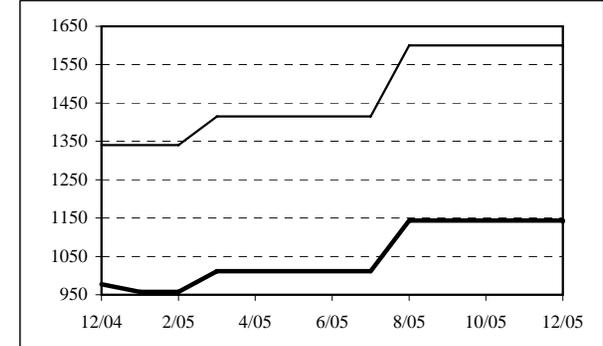

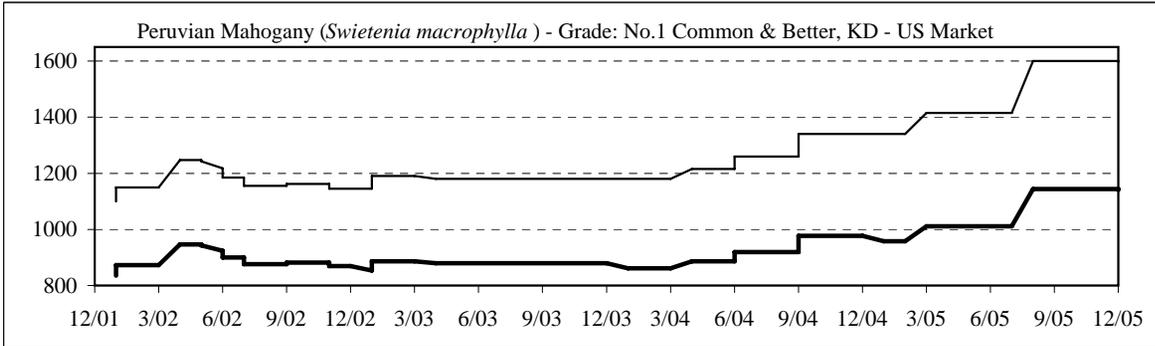

### 4-2-b. Price of Malaysian Sawwood, 1990-2005

Bold lines show FOB prices in constant 1990 US\$ per cubic meter (deflated by the IMF's Consumer Price Index for industrial countries). Normal lines show nominal FOB price trends. Grades are Kiln Dried.

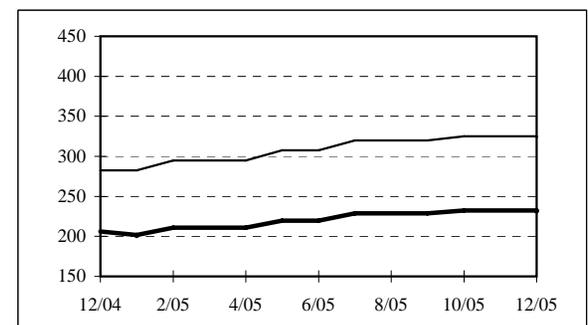

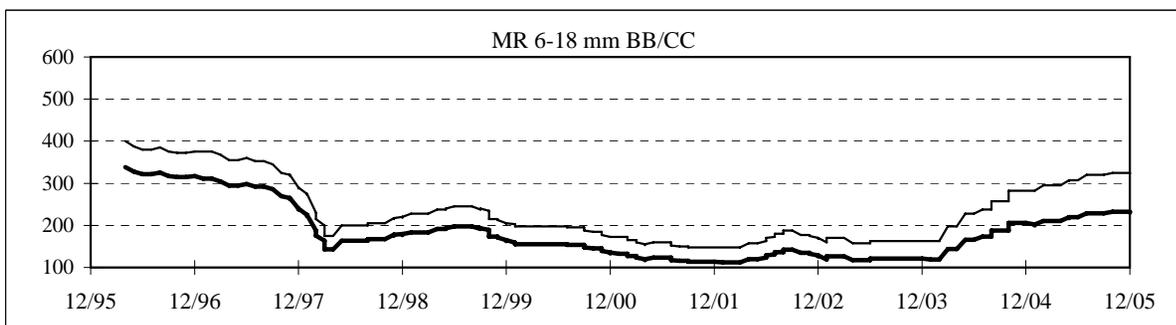

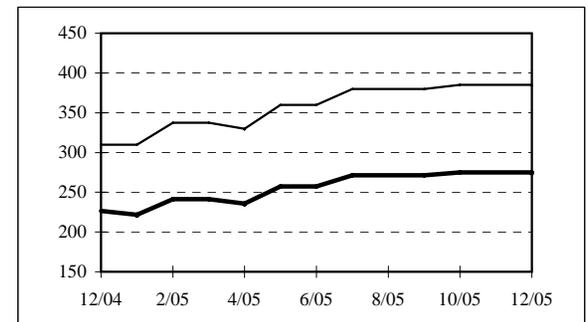

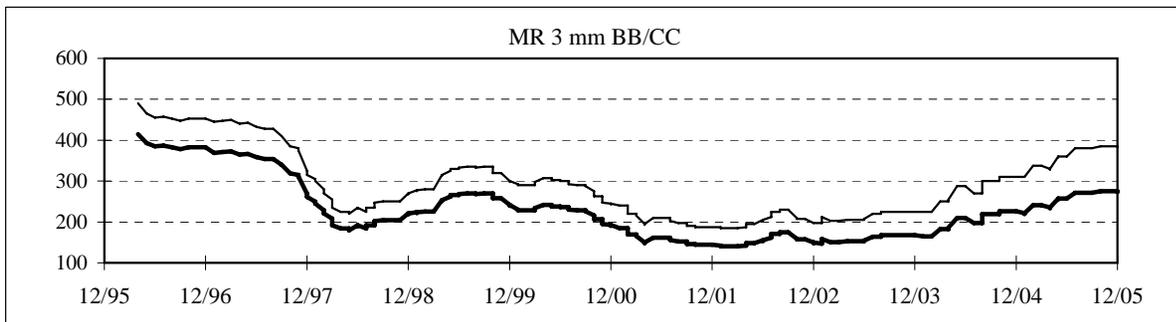

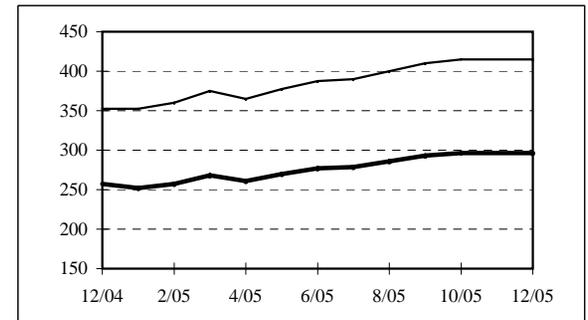

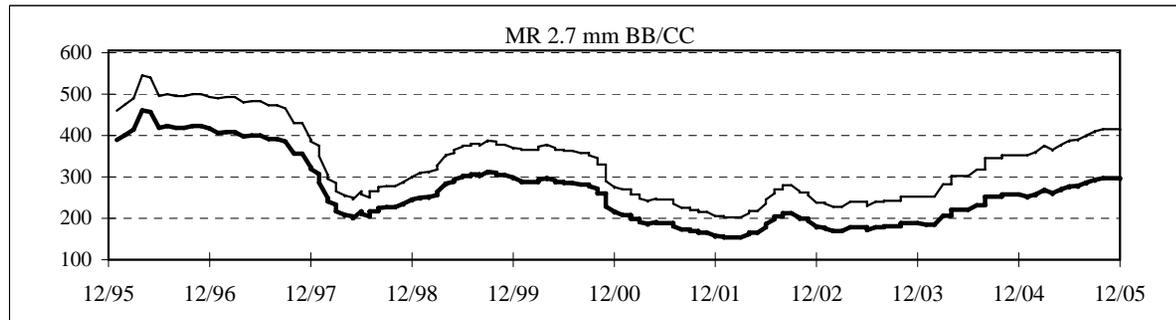

## 4-2-c. Price of Latin American Sawwood, 1990-2005

Bold lines show FOB prices in constant 1990 US\$ per cubic meter (deflated by the IMF's Consumer Price Index for industrial countries). Normal lines show nominal FOB price trends.

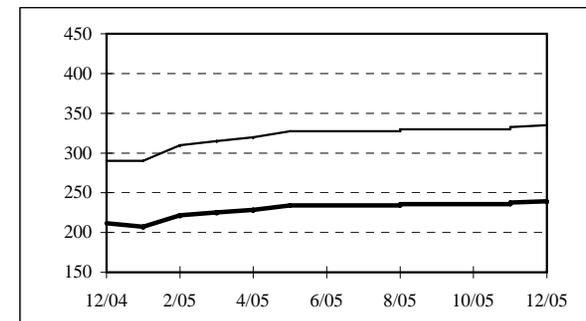

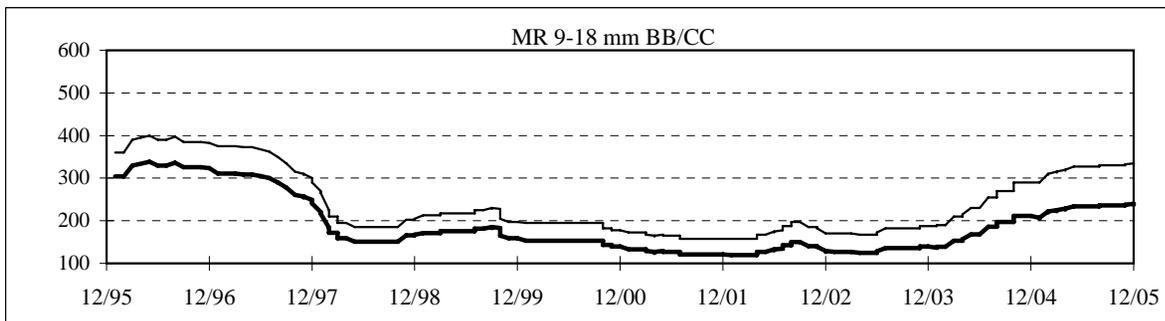

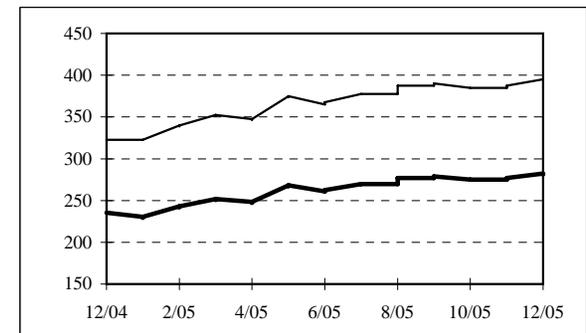

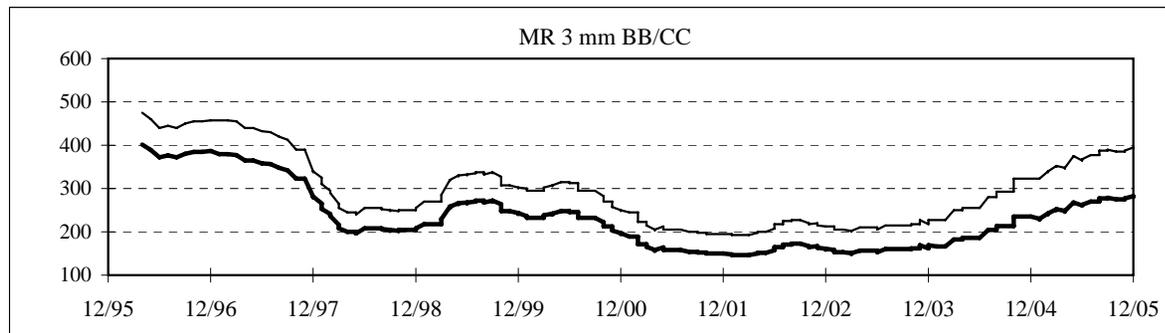

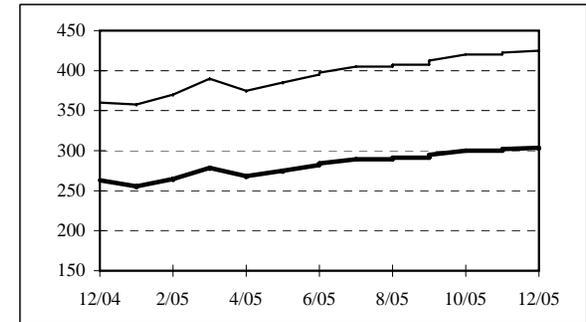

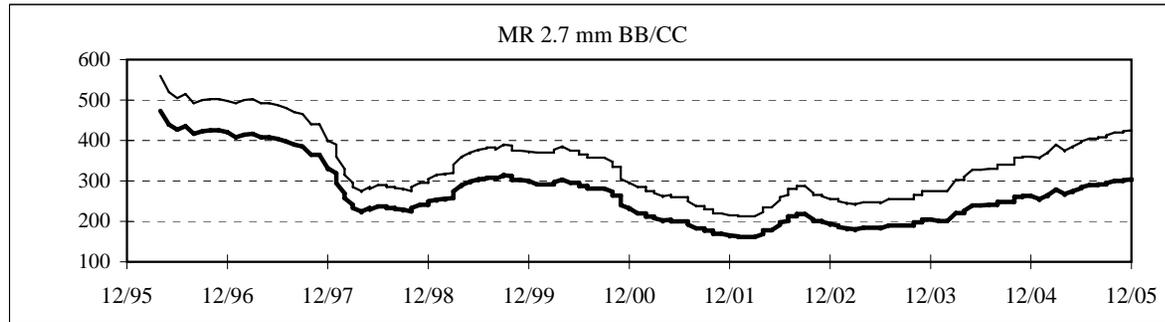

### 4-3-a. Price of Indonesian Plywood, 1996-2005

Bold lines show FOB prices in constant 1990 US\$ per cubic meter (deflated by the IMF's Consumer Price Index for industrial countries). Normal lines show nominal FOB price trends.

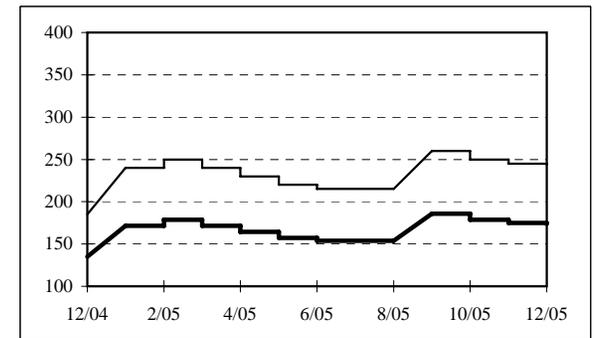

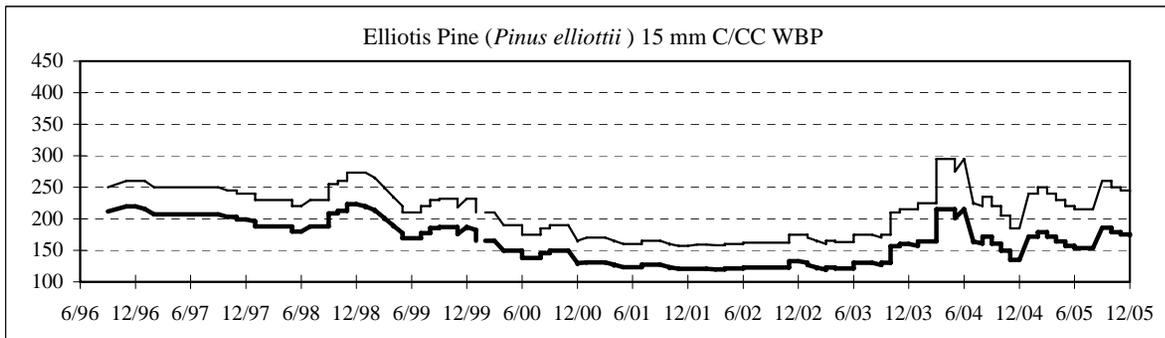

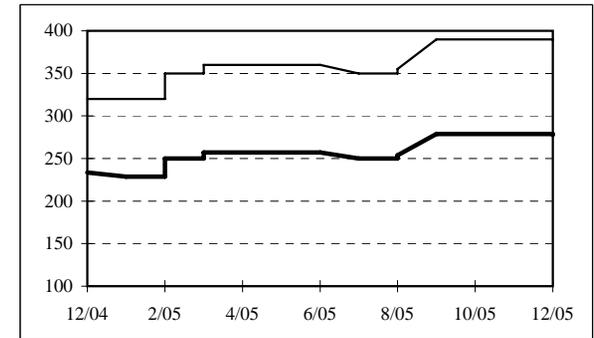

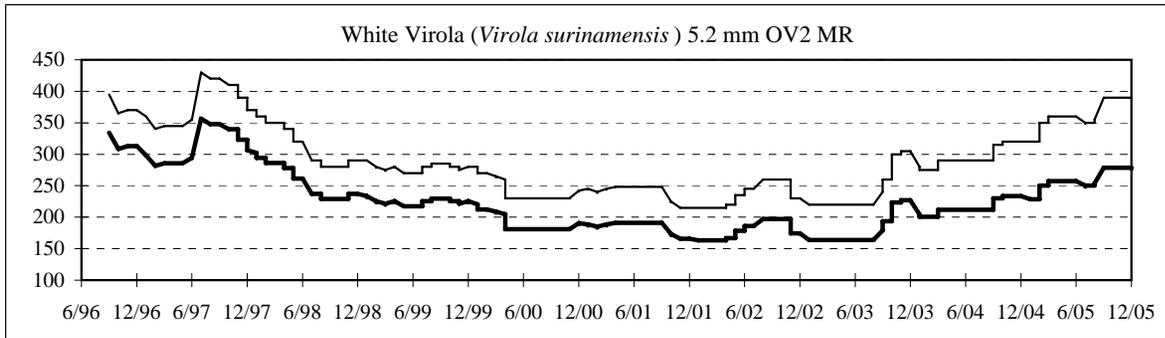

### 4-3-b. Price of Malaysian Plywood, 1996-2005

Bold lines show FOB prices in constant 1990 US\$ per cubic meter (deflated by the IMF's Consumer Price Index for industrial countries). Normal lines show nominal FOB price trends.

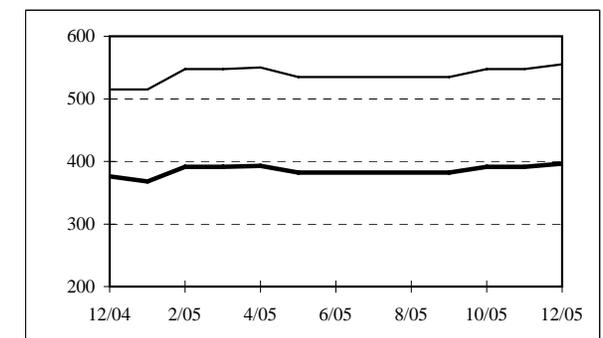

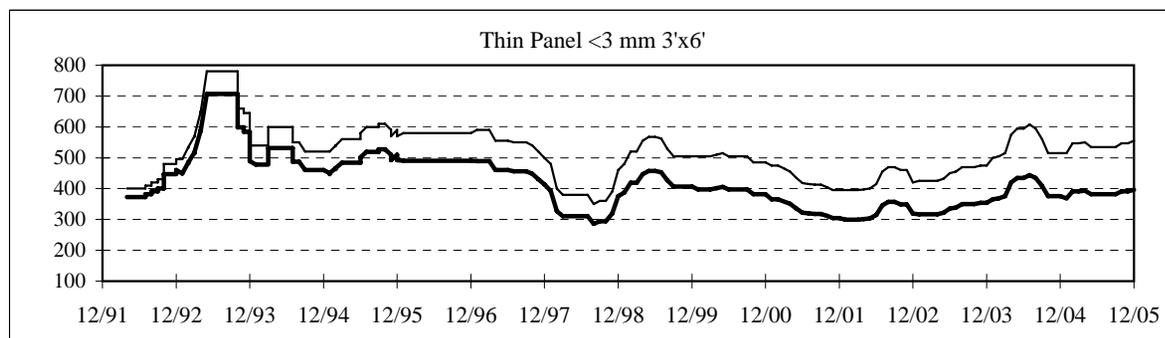

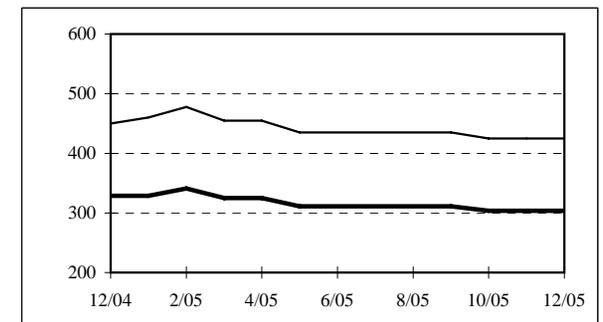

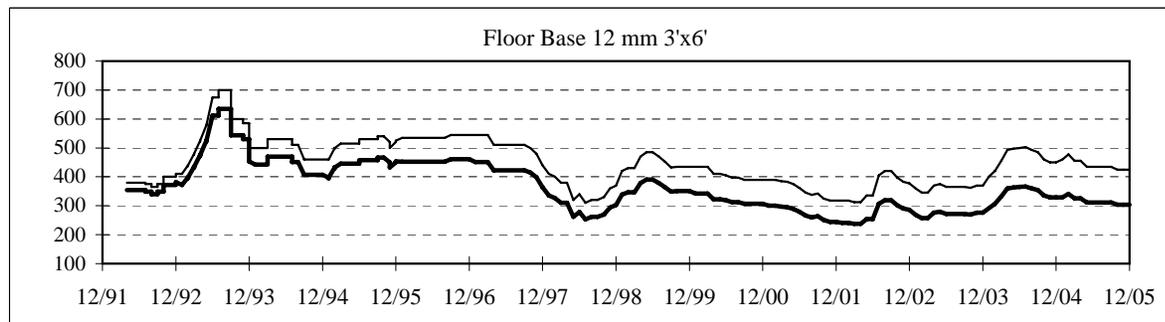

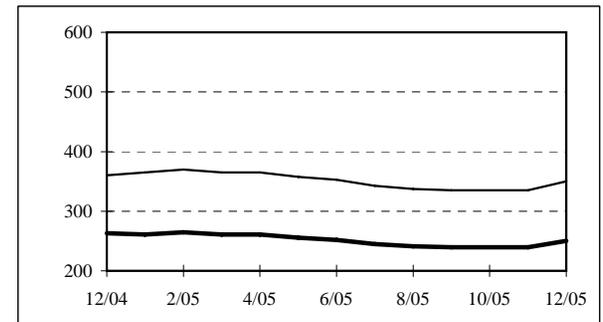

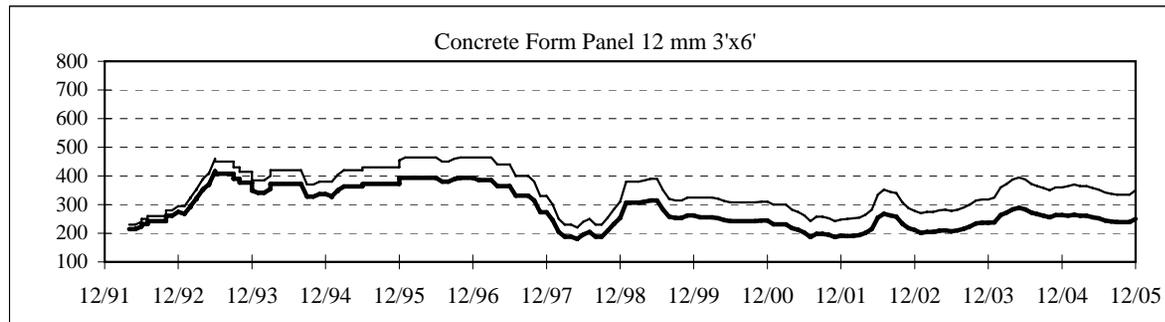

### 4-3-c. Price of Brazilian Plywood, 1996-2005

Bold lines show FOB prices in constant 1990 US\$ per cubic meter (deflated by the IMF's Consumer Price Index for industrial countries). Normal lines show nominal FOB price trends.

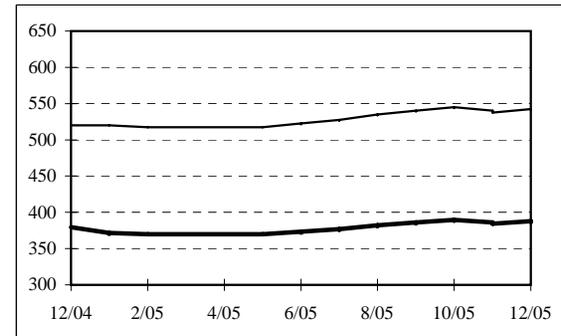

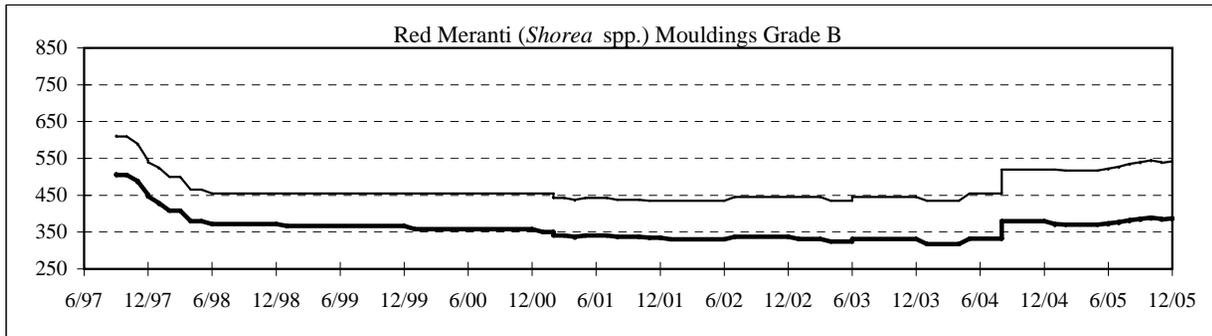

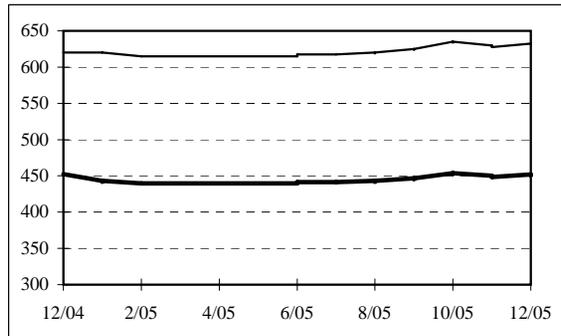

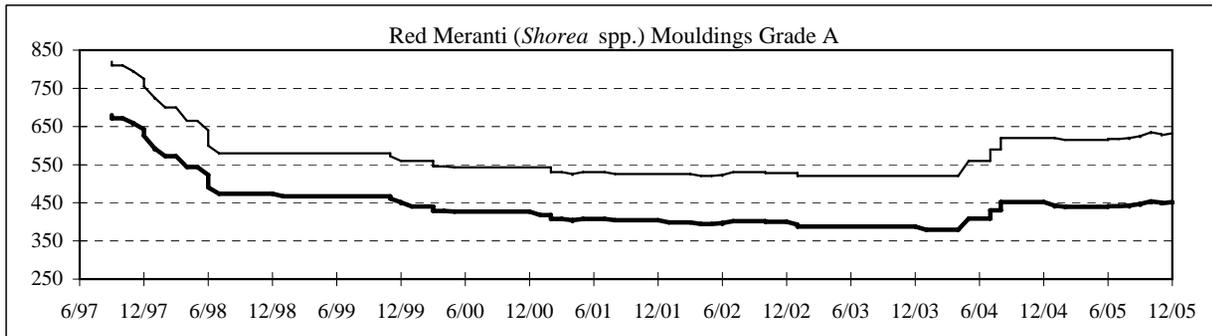

#### 4-3-d. Price of Japanese Plywood Imports, 1992-2005

Bold lines show prices in constant 1990 US\$ per cubic meter (deflated by the IMF's Consumer Price Index for industrial countries). Normal lines show nominal price trends. All prices are C&F to Japan from Indonesia. Grades for all products are B/BB Moisture Resistant.

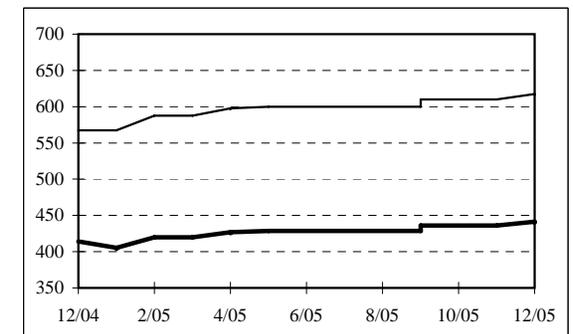

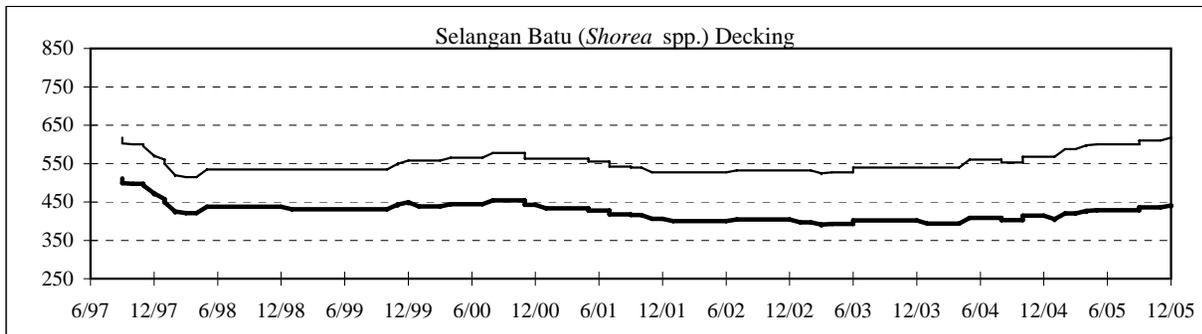

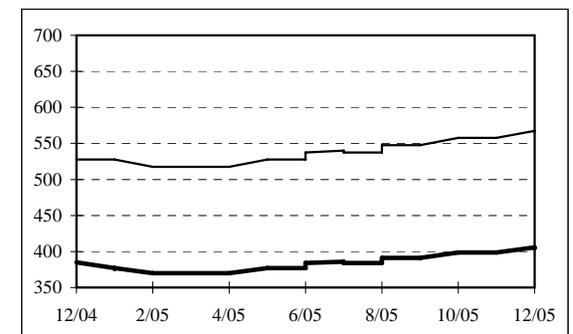

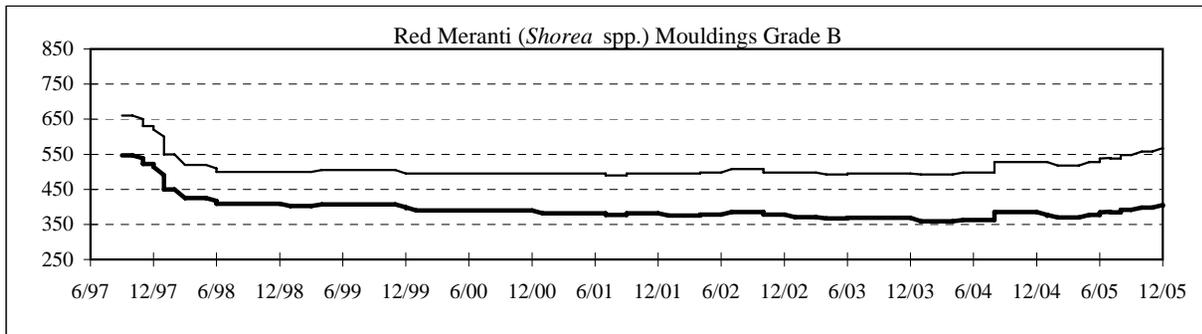

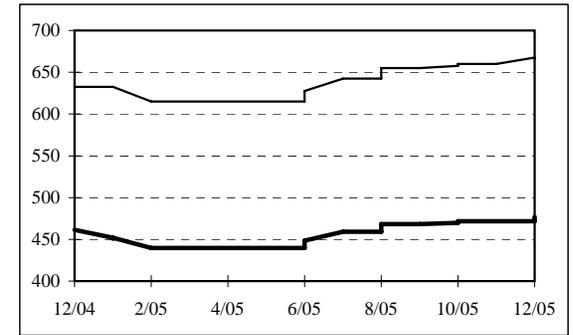

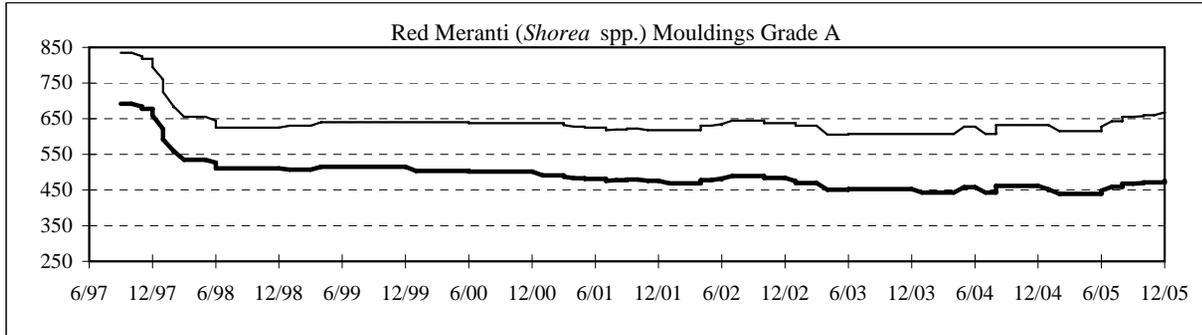

#### 4-4-a. Price of Secondary Processed Sawwood Products from Indonesia, 1997-2005

Bold lines show prices in constant 1990 US\$ per cubic meter (deflated by the IMF's Consumer Price Index for industrial countries). Normal lines show nominal price trends. All prices are FOB, Indonesia.

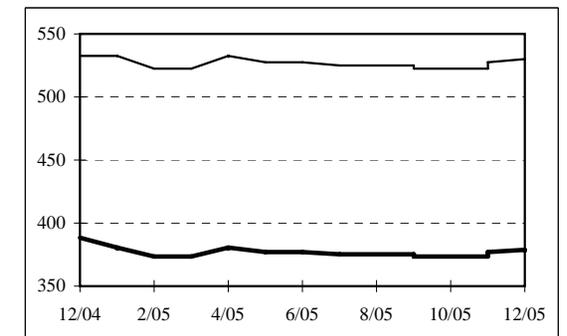

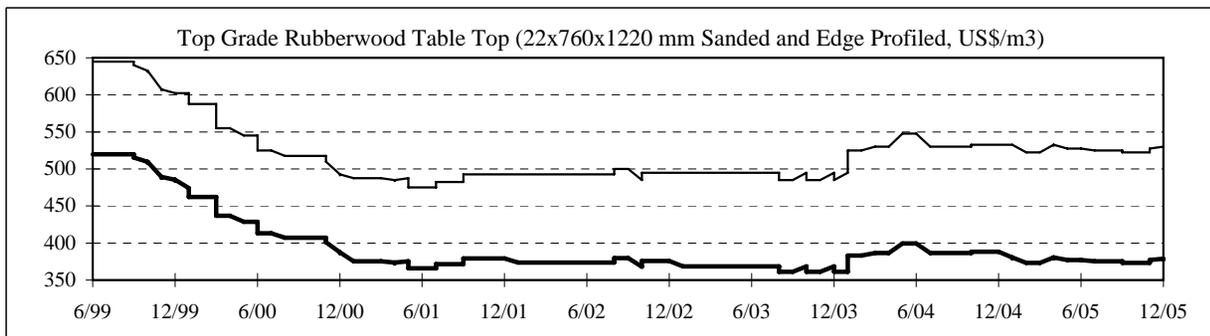

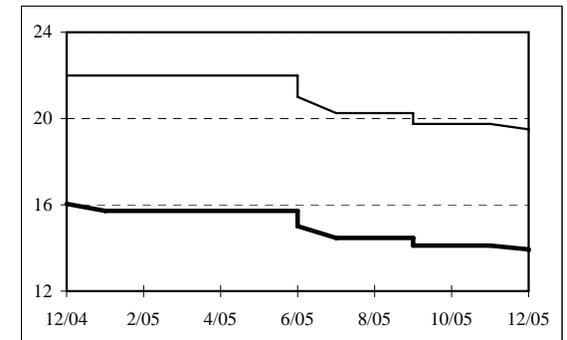

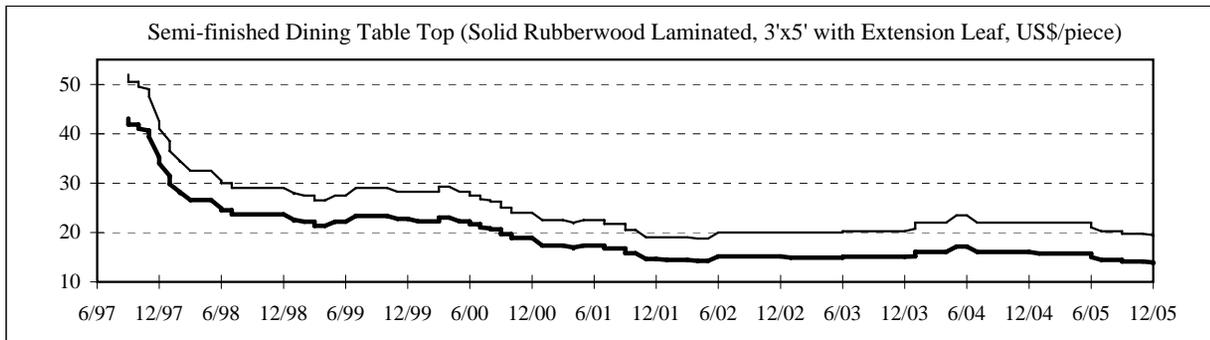

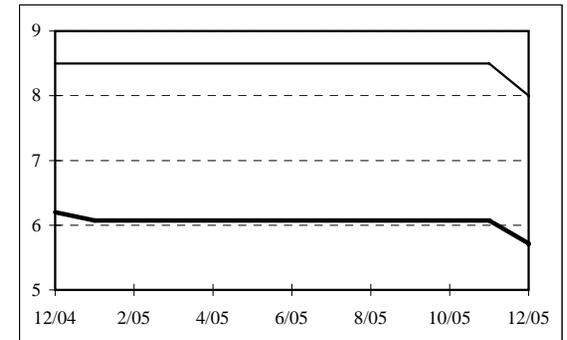

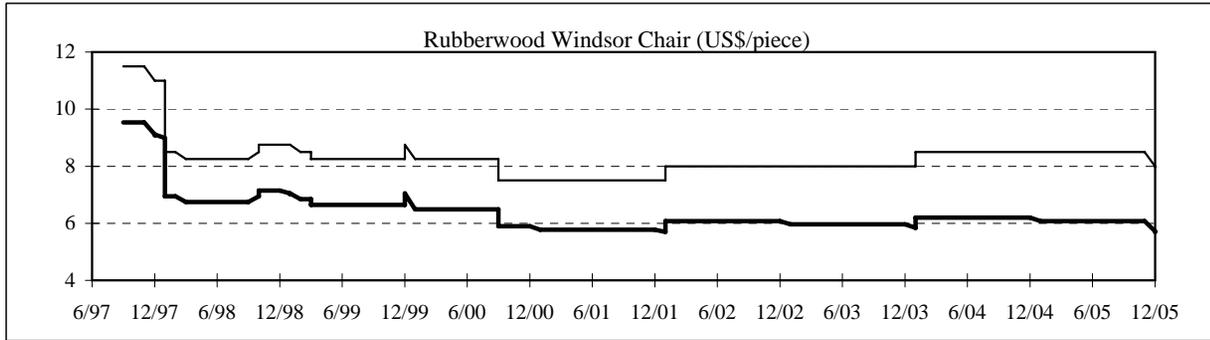

#### 4-4-b. Price of Secondary Processed Sawwood Products from Malaysia, 1997-2005

Bold lines show prices in constant 1990 US\$ per cubic meter (deflated by the IMF's Consumer Price Index for industrial countries).  
 Normal lines show nominal price trends. All prices are FOB, Malaysia.

### 4-4-c. Price of Furniture and Furniture Parts from Malaysia, 1997-2005

Bold lines show prices in constant 1990 US\$ (deflated by the IMF's Consumer Price Index for industrial countries). Normal lines show nominal price trends. All prices are FOB, Malaysia.

## Appendix 5

### Trade in Secondary Processed Wood Products, 2000-2004

## **Appendix 6**

### **UN/ECE Timber Committee Market Statement on Forest Products Markets in 2005 and 2006**

## UN/ECE TIMBER COMMITTEE AND FAO EUROPEAN FORESTRY COMMISSION STATEMENT ON FOREST PRODUCTS MARKETS IN 2005 AND PROSPECTS FOR 2006

Abridged version - the entire official text of the Market Statement  
was adopted by the UN/ECE Timber Committee  
at its sixty-second session in Geneva, Switzerland, 30 September 2005  
([http://www.unece.org/press/pr2005/05tim\\_n01e.htm](http://www.unece.org/press/pr2005/05tim_n01e.htm))

### Overview of forest products markets in 2005 and 2006

The UNECE Timber Committee reviewed the current major developments affecting forest sector policies and markets: illegal logging, inside and outside the UNECE region, the threats to economic viability of forest owners and industries from intense global competition, the challenge and opportunities presented by the growing demand for wood energy and the coming into force of the Kyoto Protocol. Governments, civil society and industry are working increasingly together to address these issues, for instance through public procurement policies, certification, corporate responsibility measures, “green building” schemes and improved communication.

The coming into force of the **Kyoto Protocol** in 2005 has brought attention to the multiple positive roles of forests and wood in carbon cycles: mitigation of the negative effects of climate change, sequestration of carbon, provision of a renewable carbon neutral energy source, substitution for non-renewable fuels or raw materials, and contribution to energy conservation. It should be better known that wood, coming from sustainable managed forests, is truly friendly to the environment: a much greater communication effort is needed to fix this impression in the public mind, replacing the many misconceptions there are at present.

The complex provisions of the Kyoto Protocol will influence all parts of the sector. Governments, the private sector and civil society should together analyse these consequences and take a proactive role in developing a strategic response to the challenges and opportunities. In the short term the main consequence has been the increased policy support for developing wood energy: many countries reported policy instruments in support of wood energy, driven by the Kyoto Protocol, but also by concerns for security and sustainability of energy supply and the high price of non-renewable energies. In some countries, prices for wood energy have risen, and there are indications that volumes have increased,

although the statistical system for monitoring this sector is still very weak. Representatives of the forest industries expressed concern that policy instruments in favour of renewable energy sources are distorting wood markets. It was pointed out that many parts of the economy were influenced by policy incentives, and that all actual or potential distortions should be taken into account, not only those linked to renewable energy. The Kyoto Protocol presents an additional opportunity to promote forests and wood products.

The **catastrophic windstorms** in the Baltic Sea region in January 2005, and the hurricanes in the Gulf region of the United States in September 2005, caused extensive forest damage with subsequent effects on roundwood and residue production. The ramifications are affecting primary wood products production in North America and Europe and have altered trade patterns.

The widespread and significant consequences for the forest sector in the UNECE region of the expansion of the **Chinese forest products industry** were discussed. Chinese industries are buying wood raw material and primary products (logs, sawnwood, recovered paper) from the UNECE region, as well as from other regions, and exporting manufactured products, notably plywood and furniture. As a consequence of the large scale of the operations and the low Chinese labour costs, prices have fallen all along the supply chain, reducing the economic viability of the European forest and timber sector. China is now the largest plywood exporter in the world and the second furniture exporter. As a response to trading practices which they consider unfair, the EU has put anti-dumping measures in place for plywood, and the US has set punitive tariffs on some Chinese furniture. At the joint EU-China summit in September 2005, the leaders of the two sides pledged to work together to tackle the problem of illegal logging in the Asian region. Meanwhile some North American and European companies are moving woodworking operations to China while maintaining their domestic marketing operations.

### **Certified forest products**

Certification policies are influencing all forest products markets sectors in the UNECE region. About 50% of the forests in western Europe and North America are now certified for sustainable forest management according to independent, internationally recognized certification programmes. Certified forests in North America and Europe account for over 96% of the world's certified forests. Demand for certified forest products is growing, driven by concern for the sustainability of supply, either by companies up and down the wood chain, or by purchasers of wood and paper products, especially business-to-business and governments. Considerably less tropical forests are certified (approximately 1% of certified forests). It is now difficult to export products from uncertified tropical forests to environmentally sensitive markets in the UNECE region, for example to the Netherlands and United Kingdom. Conversely, tropical timber from certified forests in some tropical countries, e.g. Malaysia, is finding improved export opportunities and strong market growth. Many tropical countries are not able to achieve certification in the short term and are advocating a phased approach towards certification of sustainable forest management, to enable market access during the necessary transition period and to maintain revenues to pay certification development costs. In Russia, certification of sustainable forest management is starting, and according to forecasts it will be further developed. In Europe and North America so far the great majority of forest owners have not received any premium from sales of certified wood.

### **Corporate responsibility**

Faced with concerns about illegal logging and other issues, companies in the sector, either alone or through their trade associations, are establishing corporate responsibility programmes to protect and even gain market share in environmentally sensitive markets. Many forest products companies are striving to develop the environmental and social values of forests while maintaining their own economic viability. Companies are aiming to minimize the risk of using controversial sources, by buying sustainably, or at least legally, produced wood. Some firms are benefiting from growing markets by local and national government procurement policies specifying sustainably and legally sourced timber. Trade associations stated that the multiplying public procurement programmes, with their wide variation in requirements, which

sometimes specify only certain certification schemes, are making it more complex and expensive to meet requirements of public purchasing officers. Associations call for harmonisation between the requirements of different government procurement policies. Better understanding and communication is needed on public and private (corporate) procurement policies.

### **Overall Economic Outlook**

World economic growth is expected to remain robust, although the rate of expansion will decline slightly, from 3.8% in 2004, to about 3% in 2005 and 2006. The major engines of growth have been China and the USA, but there has also been solid growth in central and eastern Europe, south east Europe and the CIS. The euro zone however has shown relatively modest growth (less than 2% in 2004) and a slowdown to about 1¼ per cent is expected for 2005. Record high and rising oil prices are dampening global economic activity. House prices have shown unprecedented growth in recent years in some countries, notably the USA. Downside risks to the short-term outlook include a further significant rise in oil prices, the widening of global external imbalances (countries expressed concern about the large US current account deficit), a sharp rise in long-term interest rates and a sudden sharp reversal of the rise in house prices.

### **Market Sector Developments**

#### **Wood raw material including wood energy**

Following record removals in 2004, roundwood removals are forecast to grow slightly in 2005 with further modest growth in 2006. The storm damage in Slovakia in late 2004 (7 million m<sup>3</sup> affected), and the Baltic region in early 2005 (85 million m<sup>3</sup> affected, of which 75 million m<sup>3</sup>, mostly spruce, in Sweden) influence these trends. In Sweden, almost half the windblown volume has been harvested, although much is still at roadside or being stocked, and the work is expected to be complete by the first half of 2006. Fellings have risen in the affected area of South Sweden and fallen elsewhere. Exports of spruce have risen, and imports fallen. Pre-storm market conditions are expected to return in 2007-2008. The hurricanes that battered the Gulf region of the US in late 2005 will also bring large volumes of roundwood to the market, at the same time as creating a huge demand for housing repair and reconstruction. Global competition has forced down roundwood prices on many markets, although the rising demand for wood energy may

cause more positive price signals. There is evidence that consumption of energy wood is growing in many regions under the influence of a high oil price and official policies to reach renewable energy goals and Kyoto Protocol commitments.

### **Sawn softwood**

Consumption of sawn softwood was at record high levels in 2004 in the UNECE region, and is forecast to increase by approximately 2% in 2005 and 2006 in Europe and North America, and by even more in Russia. Production and trade are similarly forecast to rise to new records in all subregions in 2005, although in 2006, exports are expected to drop slightly in Europe and North America. For the first time since 1998, exports of Russian sawn softwood are not forecast to increase in 2006, in line with an anticipated rise in domestic consumption. Russia's exports to its important UK market have fallen because of lack of certification of sustainable forest management, although other environmentally sensitive European markets have been maintained. In order to achieve better cooperation between the woodworking industries the European Confederation of Woodworking Industries (CEI-Bois) has launched the Roadmap 2010 action plan for public recognition of wood products as the leading material. The windstorms in the Baltic Sea region in January 2005 led to an oversupply of roundwood, mainly in Sweden: this will raise Swedish sawnwood production by an estimated 6% in 2005, or by 1 million m<sup>3</sup>. North America became a net importer for the first time in 2004, and this situation is forecast to continue in 2005 and 2006, despite increases in production in both Canada and the United States. The September 2005 hurricanes in the Gulf region destroyed up to a 400 000 (wood-based) homes, and damaged a similar number, and will create an additional demand for sawnwood and other wood products for their reconstruction and repair.

### **Sawn hardwood**

The Committee's forecasts for sawn hardwood markets are optimistic for 2005 and 2006, with rises in Europe and North America for consumption, production and trade. Demand for sawn hardwood is forecast to rise in 2005 by 5% in Europe, and 4% in North America, and by lesser amounts in 2006. European exports are forecast to continue falling in 2005, with a slight rise in 2006, while exports are expected to end a 4-year drop and begin rising. The US forecasts large import increases in 2005 and again in 2006,

presumably from offshore, while it also forecasts large increases in exports in 2005, up by 5%, and in 2006, up by 9%, with some of the increase going to Europe. Exports to the Pacific Rim will slow from the record levels in 2004. One reason for the optimistic forecasts for 2006 are new hardwood promotion efforts in the US by the Hardwood Federation, and in Europe by the European Hardwood Export Council. Hardwood producers and traders are turning increasingly to certification for assurance of the sustainability and evidence of legality of the timber. Despite the positive nature of the forecasts in Europe, hardwood trade associations drew attention to poor economic viability of the sector. Severe price erosion has been experienced for beech sawnwood in Germany, falling by 60% over the last 7 years. Beech sawlogs have dropped more, by 87%, down to a price in 2004 of Euro 52/m<sup>3</sup>. Meanwhile over the past 5 years, a few large-scale hardwood sawmills have been built in western Europe, while a number of smaller mills have gone bankrupt. Sawn hardwood producers in both North America and Europe are losing domestic markets for furniture manufacturing as capacity for these sawnwood-consuming industries moves to eastern Europe, CIS and Asia.

### **Wood-based panels**

Consumption of wood-based panels (plywood, particle board, OSB and fibreboard) in Europe in 2004 attained a new record level of 59.2 million m<sup>3</sup>. The Committee's forecasts confirm continuation of this trend. In 2005 consumption will increase by 2.7% to 60.8 million m<sup>3</sup> and marginally in 2006, with MDF and OSB continuing their strong growth. However, production costs are expected to increase as a result of record oil prices which are raising production energy, resin/glue and transport costs. Industries in Europe and North America expect higher competition for wood raw material notably residues and small diameter wood as a consequence of policies to develop the wood-energy sector. The increase of panel consumption is expected to be stronger in the CIS countries than in Europe, 6.3% in 2005 and 2006 attaining 10.2 million m<sup>3</sup> in 2006. Plywood exports from the Russian Federation, which exceed domestic consumption, will further increase in 2005 by 4.3% to 1.5 million m<sup>3</sup>. In North America overall consumption of panels is forecast to increase marginally in 2005 to 69.7 million m<sup>3</sup> and by a further 1.6 % in 2006. Demand for OSB continues to be strong. Imports from China of plywood and wooden furniture have increased sharply.

**Paper, paperboard and wood pulp**

Consumption of paper and paperboard is expected to continue to expand steadily in all parts of the region in 2005, and 2006, by 1-2% in 2005 in Europe and North America and around 3% in Russia. Production and exports in Europe will drop slightly in 2005, chiefly because of a lockout in Finland which stopped production for several weeks. Competition is global and intense, leading

to consolidation measures to correct possible over supply. Profitability is generally rather low, and strongly influenced by exchange rate movements. Fibre supply is a concern for the industry due to the competition for wood supplies from renewable energy. Certification is considered essential to maintaining the good image of paper and paperboard with consumers.
