LIST OF TABLE

1.	Criterion, weight, score, grade and rank priority for determining of representative sample plot	2
2.	List of valued candidate sample plot	4
3.	Recapitulation of the result of sample plot valuation	7
4.	Recapitulation of sample plot priority for each district	22

SUMMARY

Amount of 9 of 20 candidate sample plots was determined to be first-priority as sample plot comprising KT Tunas Mekar (Tabanan); SA Palawerdi; SA Giri Sari (Jembrana); SA Santhi Pala (Jembrana); KT Wana Tri Sad (Jembrana); KT Giri Wana Lestari (Buleleng); KT Purwanadi (Bangli); KT Gunung Agung (Karangasem); and KT Hutan Rakyat Serbaguna (Karangasem).

Amount of 8 of 20 candidate sample plots was determined to be second-priority as sample plot consisting KT Padang Ombo (Tabanan); KT Palasari (Tabanan); KT Banu Amertha (Jembrana); Pengempon Pura Rambut Siwi (Jembrana); SA Bina Karya (Jembrana); SA Kerta Yasa (Bangli); KT Palasari (Karangasem); and KT Darma Sentana (Klungkung)

Amount of 3 of 20 candidate sample plots was determined to be third-priority as sample plot consist of KT Suung Maisi (Buleleng); KT Rimba Lestari (Bangli); and KT Suka Mekar (Karangasem).

District of Jembrana had the biggest number of KT and SA to be determined as first-priority of sample plot.

1. INTRODUCTION

1.1. BACKGROUND

Establishment and measurement of permanent sample plot activity is a part of ITTO project PD 386/05 Rev. 1 (F) "Technological Development for the Production of Planting Materials to Support Sustainable Plantation of Bali Indigenous Species through Community Participation". First step of the activity started by distributing potential indigenous species seedling to community in Bali. In 2008, this activity will be continued through the establishment and measurement of permanent sample plots to determine representative plantation to be maintained as sample plot. The following report is prepared as technical report focusing on: 1) valuation of candidate sample plot, 2) criterion and determination of sample plot, 3) sample plot documentation, 4) sample plot maintenance, 5) sample plot data analysis.

1.2. MATERIALS AND METHOD

1.2.1. Materials

Establishment and measurement of permanent sample plots is a part of subsequent activities after distributing the potential indigenous species seedling to the community in Bali. The seedling was planted as enrichment planting among the previous existing trees or crops. Therefore, in one sample plot may contains varies spacing of trees or crops species. The distributed seedling consisted of 6 (six) species: panggal buaya (*Fagara rhetsa*), majegau (*Dysoxylum densiflorum*), putat (*Planchonia valida*), pulai (*Alstonia scholaris*), bentawas (*Wrightia pubescens*), and sawo kecik (*Manilkara kauki*).

1.2.2. Method

The success of plantation establishment will be influenced by some factors, such as:

1. knowledge of field biophysics conditions;
2. knowledge of species matching, both with the site and the end-product;
3. supply of improved seed, both physically and genetically;
4. silviculture techniques, from nursery up to stand management;
5. skill and effort to well manage the plantation.

Considering factors mentioned above, thus the establishment and measurement of permanent sample plots activity should be well prepared involving of: 1) valuation of candidate sample plot, 2) criterion and determination of sample plot, 3) sample plot documentation, 4) sample plot maintenance, 5) sample plot data analysis.

In accordance to the steps stated above, the scope of surveying based on consultancy with national expert, Dr. Arif Nirsatmanto, cover some topics as follows :

- Valuation technique to determine the representative sample plot
- Criterion and determination of selected sample plot

Selected sample plot will be determined based on the results of valuation using same criterion as presented in Table 01.

Table 01. Criterion, weight, score, grade and rank priority for determining of representative sample plot

Criterion	Weight (%)	Score (1: poor; 2: middle; 3: good)			Grade (value/ Total weight)	Priority (highest grade as highest priority)
		1	2	3		
1. Planning (work plan of 'kelompok tani')	10					
2. Institution (formulation and administration of 'kelompok tani')	20					
3. Implementation (meeting, field activities and self funding of 'kelompok tani')	60					
4. Controlling (progress reporting)	10					
TOTAL	100					
PRIORITY	-	-	-	-	-	-

c. Maintenance of sample plot

The maintenance involves:

- weeding,
- fertilizer,
- re-planting (if possible),
- preventing of pest and disease,
- preventing of fire,
- thinning (if necessary),
- maintenance of sample plot boundary,
- others.

d. Sample plot data analysis

Due to the location of planting by farmers spreading in different location, measurement just conducted for tree height.

e. Sample plot documentation

Sample plot documentation consists of:

- administrative location (RPH/BKPH/kecamatan/kabupaten),
- geographic location (LS-LU,BT-BB, elevation),
- name and member of 'kelompok tani',
- area, sample plot and measurement plot,
- target species, year of planting, relative spacing,
- silviculture treatment,
- biophysics data,
- others.

2. MAIN TEXT

2.1 Valuation of candidate sample plot

Some considerations for selecting representative sample plot are as follows:

- accessibility,
- soil fertilizer,
- site topography,
- water supply,
- security,
- soil and climate,
- knowledge of species matching to site condition and planting system,
- size area,
- land status,
- region representative (sub-district and or district).

The planting will be handled and managed by ‘kelompok tani’ (farmer group), thus, visits frequency of the farmers to the field should be paid attention in order to ensure the success of planting program.

Sample plot valuation has been done in 6 (six) ‘kabupaten’ (District) consisting of 20 ‘Kelompok Tani’ (KT) and ‘Subak Abian’ (SA). In general, all of KT and SA are located in site with good accessibility as reported in Table 02.

Table 02. List of valued candidate sample plot

No.	Kelompok Tani / Subak Abian	District	Remarks

Recapitulation of sample plot priority based on district is presented in Table 04.

Table 04. Recapitulation of sample plot priority for each district

No.	District	Number of location	Number of location based on priority			Remarks
			1	2	3	
1	Tabanan	3	1	2	-	
2	Jembrana	7	4	3	-	
3	Buleleng	2	1	-	1	
4	Bangli	3	1	1	1	
5	Karangasem	4	2	1	1	
6	Klungkung	1	-	1	-	
TOTAL		20	9	8	3	

In the total of 20 valued locations, it consists of 9 (nine) locations categorized as first-priority (1) of sample plot, 8 (eight) locations categorized as second-priority (2) and 3 (three) locations as third-priority (3). District of Jembrana has biggest total number of first-priority sample plots.

2.3. Maintenance of sample plot

Based on field conditions, main factors should be paid attention for sample plot maintenance are weeding, fertilizer, and pest and disease. Replanting could be practiced, and some of KT and SA need additional seedling distribution, especially for *F. rhetsa*. During the valuation was also found that some KT and SA have changed their interest to plant certain species.

2.4. Sample plot data analysis

Almost all of tree planting are managed with diverse location conditions and planting system. Therefore, in case of assessment it is collected data using simple method just for individually measurement of tree height. It also inventor the abundance of mixture trees or crops. In order to assess the trend of tree growth, measurement would be repeated for some years in the same measurement plots.

2.5. Sample plot documentation

In order to be easier monitoring and evaluation of sample plot, database of sample plot would be composed. The database contains some data and information's related to the sample plot establishment, such as:

- Administrative location (RPH/BKPH/Sub-District/District),
- Geographic location (LS-LU,BT-BB, elevation),
- Indicative and situation map,
- name and members of 'kelompok tani',
- total number of targeted species, year of planting and relative spacing,
- silviculture treatment,
- biophysics.

3. CLOSING

Amount of 20 ‘Kelompok Tani’ (KT) and ‘Subak Abian’ (SA) in 6 District across Bali, has been valued as candidate of sample plot.

The valuation was done by considering some criterions involving planning, capacity building, implementing, and controlling.

The results of valuation has classified KT and SA into three classes priority to be selected as sample plot, that is, first-priority (1), followed by second and third-priority.

Amount of 9 of 20 candidate sample plots was determined to be first-priority as sample plot, followed by 8 KT/ SA as second-priority and 3 KT / SA as third-priority. District of Jembrana had the biggest number of KT and SA to be determined as first-priority of sample plot.
